TABLE OF CONTENTS

EXECUTIVE SUMMARY

Naval Air Station Alameda (NAS Alameda) was constructed in the late 1930s and during World War II, and it played an active role in Navy aviation until it was decommissioned in 1997. JRP Historical Consulting, LLC (JRP) prepared this Combined Specific Buildings Survey and Evaluation Report / Cold War Era Historic Resources Survey and Evaluation Report of Naval Air Station Alameda under direction of the Naval Facilities Engineering Command (NAVFAC), Southwest. This report, in conjunction with a Cultural Landscape Report prepared under separate cover, is designed to assist the Base Realignment and Closure Program Management Office (BRAC PMO) West with the Navy's compliance under Section 106 and Section 110 of the National Historic Preservation Act (NHPA) as part of the undertaking to transfer former NAS Alameda out of federal ownership. Previous studies and agreements for this undertaking are discussed in **Section 1.1** and **Section 4.2,** and include the previous identification of the NAS Alameda Historic District as eligible for listing in the National Register of Historic Places (NRHP), with a period of significance of 1938-1945.[1] This report specifically supports Navy efforts to complete the identification of historic properties on NAS Alameda through the evaluation of buildings and structures constructed prior to 1989 for eligibility for listing in the NRHP and the California Register of Historical Resources (CRHR), as defined by their respective criteria for evaluation. These criteria are discussed further in **Section 4**. The evaluations will aid in the nomination of the NAS Alameda Historic District to be listed in the NRHP. Maps indicating the project vicinity, study area, and building identification numbers are provided in **Appendix A**.

This report combines two separate studies: the Specific Buildings Survey and Evaluation Report (Specific Buildings Evaluation, hereafter) and the Cold War Era Historic Resources Survey and Evaluation Report (Cold War Evaluation, hereafter). These studies, and consequently this combined report, address data gaps from previous historic resources studies and resolve issues related to known and potential historic properties, including completion of the identification of historic properties for purposes of Section 106 compliance. The role of each of the studies in this process is discussed in **Section 1.2**.

As discussed in the methodology section (**Section 1.3**), this report builds upon previous evaluations and studies. The research and analysis for this report included careful review of earlier reports, along with use of formerly overlooked data and previously inaccessible material from a variety of sources. Full citations of all the sources consulted are located in **Section 6**. Information regarding the history of the U.S. Navy, military base planning and architecture,

[1] Sally Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" (1992).

history of NAS Alameda, and specific data regarding the buildings and structures on NAS Alameda that are part of the Specific Buildings Evaluation and/or the Cold War Evaluation comprises the context provided in **Section 2**, and provide a necessary frame of reference for the evaluation of the buildings, structures, objects, and landscape of NAS Alameda. This report covers 442 buildings and structures located on NAS Alameda. These resources can be divided into nine categories: administrative/training; aircraft/missile overhaul and repair; airfield/seaplane facilities; morale, welfare and recreation; ordnance/magazines; public works/infrastructure; residential and subsistence; storage; and water front operations. They are described in **Section 3** and individual or small group descriptions and evaluations are found on the DPR 523 forms in **Appendix C.**

Evaluations use the National Register Criteria for Evaluation and the California Register Criteria for Evaluation, as explained in **Sections 4.1.1 and 4.1.2**. Guidance for the evaluations in this report includes *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation, National Register Bulletin 22: Guidelines for Evaluating and Nominating Properties that have Achieved Significance within the Last Fifty Years,* and the Department of Defense's statewide study "California Historic Military Buildings and Structures Inventory." Furthermore, the Department of Defense and the Navy have entered into agreements regarding Section 106 compliance for specific types of buildings frequently found on installations across the country, some of which apply to resources on NAS Alameda. These agreements are discussed generally in **Section 1.3.2**, and specifically applied to NAS Alameda in **Section 4.1.3**. Evaluations for the studies in this report are in **Sections 4.3** and **4.4**.

Overall this report concludes in **Section 5** that no buildings, structures, or objects studied for this report meet the criteria for listing in the NRHP or CRHR individually under World War II or Cold War-era contexts. One historic district, the NAS Alameda Historic District, was previously identified the NAS Alameda Historic District is eligible for listing in the NRHP under NRHP Criteria A and C (CRHR 1 and 3) with a period of significance from when construction of the station began in 1938 to the conclusion of World War II in 1945. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development. The historic district and its contributors retain sufficient historic integrity to convey their collective significance to the period of significance. The NAS Alameda Historic District, however, does not have important associations with historically significant themes of development during the Cold War period.

This report identifies thirteen new contributors to the historic district and expands the district boundaries, as shown in the map at the end of this section and as described in **Section 5**. The thirteen new contributing resources in the NAS Alameda Historic District were originally completed in 1940 or 1941. They are the Seaplane Lagoon, Seaplane Lagoon Ramp 1, Seaplane Lagoon Ramp 2, Seaplane Lagoon Ramp 3, Seaplane Lagoon Ramp 4 (Building 200687), Bulkhead (Building 200648), Jetty (Building 200650), Building 5, Building 10, Building 15, Building 19 (Control Tower), Building 35, and Building 64. The historic district's period of significance remains 1938-1945. The NAS Alameda Historic District contains 156 buildings and structures, 99 buildings and structures contribute to the district and are listed in **Table 1**. Fifty-seven buildings and structures are non-contributors. Maps of this historic district and tables of the contributors and non-contributors are in **Figure A-4**, **Appendix A** and **Table B-5** and **Table B-6**, **Appendix B** respectively.

NAS Alameda Historic District as defined by this report

1. INTRODUCTION

JRP Historical Consulting, LLC (JRP) prepared the Combined Specific Buildings Evaluation Report / Cold War Era Historic Resources Evaluation Report for Naval Air Station Alameda (NAS Alameda) under direction of the Naval Facilities Engineering Command (NAVFAC), Southwest. This report, in conjunction with the Cultural Landscape Report prepared under separate cover, will assist the Base Realignment and Closure Program Management Office (BRAC PMO) with the Navy's compliance under Section 106 and Section 110 of the National Historic Preservation Act (NHPA) as part of the undertaking to transfer former NAS Alameda out of federal ownership. Specifically, the report evaluates buildings and structures on NAS Alameda for listing on the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR).[2] The evaluations, along with the separate Cultural Landscape Report, support efforts to complete the identification of historic properties on NAS Alameda and to nominate the NAS Alameda Historic District to the NRHP. The project vicinity and study area for this report are illustrated in **Figure A-1** and **Figure A-2**. For reference, maps with Navy building identification numbers are provided in **Figure A-3a**, **Figure A-3b**, and **Figure A-3c**. These figures are in **Appendix A**.

This introduction provides information regarding previous historic resources studies on NAS Alameda, the purpose and organization of this document, methodology for preparation of this study, and a summary of findings.

1.1. Summary of Previous Studies and Consultations

Previous studies of historic resources on NAS Alameda identified the "NAS Alameda Historic District" as eligible for listing in the National Register of Historic Places (NRHP). The overall district is considered a historic property for purposes of Navy compliance with NHPA Section 106. The historic district includes contributing buildings plus contributing landscapes, streetscapes, and viewsheds. Previous studies subdivided the historic district into functional areas: Administrative Core, Shops Area, Hangars Area, and Residential Area.[3] None of the

[2] Although this report provides evaluations for eligibility under the California Register of Historical Resources, the City of Alameda may identify additional resources meeting local or state historical resources criteria. As one example of this, the City of Alameda's Historic Advisory Board (HAB) concluded that several buildings, structures, and appurtenances on the former NAS Alameda "held special importance for local Alameda history and people" and added these resources to the City of Alameda Historic Study List on June 2, 2011 via HAB Resolutions HAB-11-07 and HAB-11-08.

[3] Stephen Mikesell (JRP Historical Consulting Services), "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997. The "Hangars Area" has been identified as the "Operations Area" in the "Cultural Landscape Report for NAS Alameda" (2011), also prepared by JRP. This reflects the wider functions of

buildings in the district were identified as individually eligible for listing in the NRHP. NAS Alameda was also addressed in the Department of Defense's statewide historic resource study of military facilities in California (discussed below). The following four previous investigations focused on identifying, documenting, providing guidance for, and preparing a NRHP nomination for the NAS Alameda historic district:[4]

- Sally Woodbridge, "Historic Architectural Resources Inventory for Naval Air Station, Alameda," 1992
- Stephen Mikesell (JRP Historical Consulting Services), "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997
- JRP Historical Consulting Services, "California Historic Military Buildings and Structures Inventory," 2000
- Jones & Stokes, "Final Historic Properties Inspection Report," 2007
- Jones & Stokes, "Pre-Final National Register of Historic Places Nomination for the NAS Alameda Historic District," 2008

The Navy determined that the NAS Alameda Historic District was eligible for listing in the NRHP in 1992 based on the "Historic Architectural Resources Inventory for Naval Air Station, Alameda," prepared by architectural historian Sally Woodbridge. The State Historic Preservation Officer (SHPO) concurred with the Navy's conclusion in September 1992. The Woodbridge report provided the initial inventory and evaluation of the historic district, which included 85 resources, and concluded the district was eligible for the NRHP under Criteria A and C. Through the Navy's subsequent consultation with SHPO, and following a fire in one building, the NAS Alameda Historic District included 86 contributing resources. The Woodbridge report concluded the NAS Alameda Historic District was eligible under Criterion A for its significance as a World War II-era naval air station (1938-1945) under the contextual theme of the development of U.S. Navy bases in the San Francisco Bay Area in World War II. The Woodbridge report further stated that the historic district's significance under Criterion C rests

the area in which the hangars are situated and their relationship with adjacent spaces including the Seaplane Lagoon and the Airfield.

[4] In addition to the Navy's reports, the Alameda Reuse and Redevelopment Authority (ARRA) hired Page and Turnbull to prepare the "NAS Alameda Historic District, Historic District Assessment and Historic Preservation Strategy and Alameda Point Preliminary Development Concept" in 2005 as part of documentation prepared for a previous master development plan / master plan proposed for former NAS Alameda. The Page and Turnbull report provided some analysis and recommendations regarding historic preservation issues as part of the redevelopment project. This report did not evaluate National Register of Historic Places or California Register of Historic Resources eligibility of resources on NAS Alameda.

upon its master planning and architecture in the Moderne style. The Woodbridge report did not, however, evaluate all of the buildings and structures located inside the proposed historic district boundary, and the report did not consider potential Cold War-era eligibility for the buildings and structures on NAS Alameda. Thus, none of the buildings and structures on the station built before 1946 has previously been evaluated for Cold War-era use, and none of the buildings and structures on station built after 1945 was previously evaluated.

The Navy had the "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" prepared to expand on the Woodbridge study in several ways. The report provided context regarding the Moderne architectural style and its use on the station. The report also identified the character-defining elements of the historic district with attention to the four main functional areas. General character-defining elements of each functional area were identified, along with character-defining elements of individual buildings. Lastly, the report identified the significant vistas / viewsheds, open spaces, streetscapes, and some landscape elements that contribute to the historic district's eligibility under Criterion C. The report was intended to help guide treatment of the NRHP identified historic district on the then-closed station.

While not focused specifically on NAS Alameda, the Department of Defense's "California Historic Military Buildings and Structures Inventory" (hereafter Statewide Study) addressed the station as part of its examination of identifying historic military properties in California. The three volume report is an important tool that provides historical and architectural context for the evaluation of military buildings. Most helpful in the evaluation of buildings and structures on NAS Alameda is the contextual information regarding military base design prior to World War II. In addition, the holistic approach to military history during World War II and the Cold War identifies significant themes providing a consistent basis for building and structure evaluation across the state. This thematic base assists in clarifying Woodbridge's evaluation of the station, and provides a framework for evaluating the Cold War-era buildings and structures on NAS Alameda.

Following the decision to close NAS Alameda in 1993, the Navy, Advisory Council on Historic Preservation (ACHP), and California SHPO consulted regarding the undertaking to transfer the facility out of federal ownership. In 1999, these parties were signatories to a Memorandum of Agreement (MOA) regarding the layaway, caretaker maintenance, leasing, and disposal of historic properties on former NAS Alameda. The MOA noted that the historic district, as defined by Woodbridge's 1992 report, is eligible for inclusion in the NRHP and is a historic property for Section 106 compliance. This MOA required the Navy to complete the following tasks related to historic preservation prior to transferring the base to City of Alameda / Alameda Reuse and Redevelopment Authority (ARRA): 1) prepare and submit a National Register

nomination for the Historic District; 2) donate or permanently loan the inventory of historic artifacts from NAS Alameda to museums in Alameda or the San Francisco Bay area; 3) follow the "Maintenance and Repair Guidelines for the Naval Air Station Alameda Historic District" extracted from the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" for long term preservation planning.[5] As part of the Section 106 compliance efforts, the Navy had prepared the "Final Historic Properties Inspection Report" (HPIR). This document was intended to further assist the Navy with the appropriate management of the historic district. The report concluded that the historic district overall was in good condition and still conveyed a strong sense of a World War II-era naval air station. The document noted that although some buildings and structures suffered from varying degrees of deferred maintenance since being evaluated in 1992, the contributors to the historic district were largely unaltered and the prominent buildings still represented Moderne style architecture. The inspection found that the vast majority of character-defining features identified in 1997 remained in place. In addition, the HPIR identified no substantial modern intrusions in the historic district, and that the open spaces, vistas, and viewsheds from the original 1992 inventory were still intact. Furthermore, the HPIR identified no major structural issues with the contributing buildings and structures in the historic district.

The Navy took additional steps to comply with stipulations of the 1999 MOA by having a National Register nomination prepared. The resulting unfinished "Pre-Final National Register of Historic Places Nomination for the NAS Alameda Historic District" relied on the Woodbridge evaluation and provided the basic framework for the National Register nomination scoped at the time. Interested parties in the process raised concerns regarding the limitations of the Woodbridge study (and thus the pre-final National Register nomination). These concerns included: the number of unevaluated buildings inside the proposed historic district boundary; the lack of a survey and evaluation in the context of the Cold War period; and the need for a Cultural Landscape Report. Because of the limitations of the Woodbridge report and the outcome of Navy consultation with interested parties, the pre-final National Register Nomination was not finalized and was not submitted to the Keeper of the National Register.

[5] Stephen Mikesell, JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" (prepared for Engineering Facility, West, Naval Facilities Engineering Command, San Bruno, 1997).

1.2. Purpose and Organization of Document

The purpose of the Combined Specific Buildings Evaluation / Cold War Era Evaluation Report is to assist the Navy with its compliance under NHPA Section 106 and Section 110 as part of the undertaking to transfer former NAS Alameda out of federal ownership. The document is intended to help resolve data gaps from previous historic resources studies and to resolve remaining issues related to known and potential historic properties, including completion of identification of historic properties. This study, combined with the conclusions from the Cultural Landscape Report, will be used as a basis for preparation of a final National Register Nomination Form for the NAS Alameda Historic District that will be submitted to the Keeper of the National Register. The Navy will also add information from this inventory and evaluation of buildings, structures, objects, sites, and districts to the Geographic Information System (GIS) data layers it has collected for NAS Alameda. JRP is providing additional data layers as a part of this project.

The Navy directed JRP to prepare the current report to provide evaluations of potential Cold War-era eligibility of resources, to reconsider buildings of interest to consulting parties, and to address limitations of the original evaluation by Woodbridge completed in 1992. The current report expands, refines, and in some cases corrects the Woodbridge evaluation. In particular, thirteen (13) buildings / structures previously identified as non-contributors are proposed for inclusion in the NAS Alameda Historic District.

The passage of time, subsequent consultation, the preparation of management documents for the historic district, and additional research conducted for this report have revealed particular limitations of the Woodbridge evaluation. Specifically, the Woodbridge evaluation:

- identified non-contributing elements of the Historic District outside of the district boundary;
- did not fully record or evaluate on site forms temporary, non-descript structures;
- had inaccuracies concerning some dates of some building alterations; and
- did not evaluate the airfield at the western edge of the former installation.

Importantly, the current report does not explicitly reevaluate buildings identified by Woodbridge as contributing elements of the original NAS Alameda Historic District. JRP and the Navy reviewed the adequacy of Woodbridge's arguments concerning significance and historic integrity of these resources. Based on the rigorous research conducted for this report and the historic context of the station's development presented herein, the Navy continues to consider the previously-identified contributing elements as components of an eligible historic district.

Therefore, the Navy is not seeking reconsideration of the contributing elements identified in the Woodbridge evaluation within the context of World War II.

Based upon a review of the current report, the Navy also concludes that the revised NAS Alameda Historic District identified herein improves understanding of the station's historic significance and appropriately represents the significance of NAS Alameda prior to and during World War II. The Navy asserts that the revised Historic District strikes a proper balance between honoring the outcome of prior consultation/concurrence, and considering new information and the input of members of the public with an interest in these historic resources.

This report combines the Specific Buildings Evaluation and the Cold War Evaluation. The purpose and organization of this report is intended to provide information and analysis regarding: 1) specific buildings that the Navy identified which are related to the station's initial development and World War II history; and 2) to provide information and analysis regarding buildings, structures, and objects on the station as they relate to the Cold War period. These two groups of buildings, structures, and objects are the survey resources for the studies combined in this report. Within this report, the historic context, property types, and conclusions for the two groups of resources are clearly defined and separated to facilitate consultation with SHPO and interested parties. The historic context is built around three variables: theme, place, and time. Conforming to the Statewide Study, the overarching theme for resources on NAS Alameda is military preparedness. The historic context for buildings, structures, and objects on NAS Alameda include World War II / pre-war build up (1938-1945) and the Cold War era (1946-1989). In addition to theme, place, and time, the historic context relies upon the concept of a "property type" for practical applications. A property type is a building, structure, site or other type of property known to have been associated with a historic theme. Examples of property types for the World War II period on NAS Alameda include new permanent installations constructed as part of pre-war preparedness, and examples during the Cold War include facilities to support sailors serving overseas and reserve squadrons.[6] Tables are provided in **Appendix B** to facilitate this discussion. All buildings, structures, and objects inventoried for this report are in **Table B-1**. Buildings and structures not recorded, discussed below, are in **Table B-2**.

The buildings, structures, and objects selected for the Specific Buildings Evaluation include those constructed before 1946 that had not been previously evaluated or that had received insufficient evaluation in previous reports. These were reconsidered for potential eligibility either as individual properties within the context of World War II, or as possible contributors to

[6] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 1-1 – 1-2.

the NAS Alameda Historic District. In addition, buildings identified by Woodbridge as non-contributing elements were reevaluated for eligibility at the request of interested parties; however, this report, as noted above, does not reevaluate buildings and structures previously identified as contributing elements of the NAS Alameda Historic District. One hundred and five buildings, structures, and objects, within and outside the historic district boundaries for surveyed and evaluated the Specific Buildings Evaluation. These resources include those previously recorded by Woodbridge, as well as resources identified through review of Navy building records. The buildings surveyed and evaluated in the Specific Buildings Evaluation are listed in **Table B-3, Appendix B**.

The Cold War Evaluation included all buildings / structures within the Specific Buildings Evaluation, buildings previously evaluated in the Woodbridge report, and all buildings, structures, and objects constructed in the Cold War era (1946-1989) on NAS Alameda. Extant buildings constructed prior to 1946 were used during the Cold War; therefore all the buildings included in the Specific Buildings Evaluation are included in the Cold War Evaluation. The Cold War study evaluates whether any buildings, structures, or objects are eligible for the NRHP for significance achieved during the Cold War era (1946-1989) including buildings built during that time period and those built prior to 1946 that were utilized during the Cold War. Buildings within the NAS Alameda Historic District were previously evaluated for their significance within the World War II context, and were not evaluated for continued use or reuse during the Cold War. Buildings constructed after 1945 are located within and adjacent to the NAS Alameda Historic District, as well as other portions of the station. These resources have not previously been subject to historic resources survey. This report completes that evaluation. The buildings, structures, and objects to be surveyed and evaluated within the Cold War era context are listed in **Table B-4, Appendix B**.

This report includes context for both survey populations in Section 2. World War II context for the Specific Buildings Evaluation is located in Section 2.1 and the Cold War context is in Section 2.2. Descriptions of property types for both surveys are in Section 3, which describes buildings and structures in the Specific Buildings Evaluation in Section 3.1 and then those same buildings along with Cold War-era resources are discussed in Section 3.2. The eligibility of buildings, structures and objects in the two studies are outlined in Section 4. Conclusions are located in Section 5. References are in Section 6. Additional information is located in the Appendices. Maps and aerial photographs are in **Appendix A**, tables in **Appendix B**, DPR 523 forms in **Appendix C**, preparer's qualifications in **Appendix D**, GIS data layer information in **Appendix E**, applicable Program Comments in **Appendix F,** and Navy responses to public comments and correspondence with SHPO in **Appendix G**. A Cultural Landscape Report is under separate cover.

1.3. Methodology

JRP conducted research and fieldwork for the combined studies presented in this report from August 2009 to January 2010. Research encompassed information regarding the history of the U.S. Navy, military base planning and architecture, history of NAS Alameda, and specific data regarding the buildings and structures on NAS Alameda that are part of the Specific Buildings Evaluation and/or the Cold War Evaluation. The research undertaken helped refine historical context and themes of NAS Alameda as well as supplemented site and resource specific data in order to satisfactorily justify the identification of station's period of significance and property types. This included review of previous historic resources studies prepared for NAS Alameda. JRP also reviewed the Environmental Baseline Survey (EBS) and Supplemental EBS data for NAS Alameda, which the Navy provided to JRP. The Navy provided baseline specific building information from the Internet Naval Facilities Assets Data Store (iNFADS) as published in 2008, including data regarding year built, square footage, and last use of facilities. As part of the initial research tasks, JRP requested that a records search of the California Historical Resources Information System (CHRIS) be prepared at the Northwest Information Center (NWIC) at Sonoma State University. NWIC responded to the records center request informing JRP that it did not have previous documentation related to NAS Alameda, nor additional information regarding historic resources on the station. JRP carried out research prior to, during, and following fieldwork and undertook research in Navy records and local repositories including:

- NAS Alameda Administrative Records, Building 1 NAS Alameda, Alameda, California
- National Archives and Records Administration, San Bruno, California
- Civil Engineering Corps / Seabee Museum, Naval Base Ventura, Port Hueneme, California
- Treasure Island BRAC PMO West Caretaker Site Office, San Francisco, California
- Alameda Free Library, Main Branch, Alameda, California
- Oakland History Room, Oakland, California.
- Alameda Naval Air Museum (ANAM)

JRP also conducted limited interviews with persons associated with NAS Alameda and that had knowledge of specific buildings, structures, and objects on station. The Navy provided names and information of informants to interview. JRP interviewed Marilyn York, Barbara Baack, Richard Rutter (USN Ret.), Bronson "Chief" Parry (USN Ret.), and Doug Delong. In addition, efforts were made to collect previously conducted interviews at the Alameda Naval Air Museum or the Alameda Public Library, though none were located.

Fieldwork was divided into subareas of the station and was closely coordinated with Doug DeLong, Environmental Compliance Manager BRAC PMO West. The five subareas for fieldwork were: 1) area in and around the historic district, excluding residential areas; 2) residential areas at the northeast corner of the station; 3) airfield; 4) buildings / structures in the southeast corner of station; and 5) select building interiors. The Navy provided JRP a master list of buildings, structures, and objects on NAS Alameda for field survey and evaluation. During the course of the inventory, not all of the resources listed could be located for recordation. These properties are listed in **Table B-2, Appendix B**. Certain infrastructure elements that the Navy requested be inventoried for this project could not be surveyed using standard fieldwork survey methods and others were not located by JRP field crews. These resources included underground utilities and minor ubiquitous features. Some infrastructure elements listed in Navy building records do not have a geographical association that is either described or mapped in available sources. These resources included features such as roads, parking areas, and sidewalks. JRP attempted to locate infrastructure features through station histories, mapping, and construction documents. The Navy also provided JRP access to GIS data layers that included the location of some of these features. Such data was collected by the Navy and/or by other consultants. JRP did not enter underground utility spaces for recordation purposes. Some resources listed in Navy building records are no longer extant.

JRP's fieldwork inspection of buildings, structures, and objects included photographing each resource and taking field notes for recordation on California Department of Parks and Recreation (DPR) 523 forms. JRP recorded the data obtained during fieldwork and research on DPR 523 forms for the resources of both the Specific Buildings Evaluation and Cold War Evaluation. Previously recorded properties received update forms, which provide updated description of resources and additional information. JRP prepared the DPR 523 forms according to the California Office of Historic Preservation's "Instructions for Recording Historic Resources" (March 1995). Each form includes digital photographs, sketch / location maps, building descriptions, and eligibility evaluation and assessment of historic integrity. Information regarding the character-defining features of resources is presented on forms of resources that are eligible for listing in the NRHP. As part of the inventory process, JRP grouped some buildings, structures, and objects together on forms to facilitate evaluation, per standard practice and like the methodology used in the Woodbridge report. The groupings were based on similar design or use pattern and/or functional use in a specific geographic area of the base. Resources on a group form share similar histories and functions. Inventory site forms from the Woodbridge report and excerpts from the "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" were also appended to the update forms. The additional information appended to the update forms was not incorporated into the body of those forms so that the reader can readily review the previous inventory and analysis that is being updated.

Evaluation of buildings, structures, and objects followed guidance from state and national sources and was based on information collected on the individual buildings as well as the context for NAS Alameda prepared for the report. *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* provided general evaluation guidance. Mid to late Cold War-era properties were also evaluated under Criteria Consideration G, for properties that are less than fifty years old. Application of Criteria Consideration G is discussed fully in *National Register Bulletin 22: Guidelines for Evaluating and Nominating Properties that have Achieved Significance within the Last Fifty Years*. The "California Historic Military Buildings and Structures Inventory" (Statewide Study) provided additional guidance for the evaluation of military properties, including World War II and Cold War-era properties. Based upon how historic structures and buildings have been previously evaluated by the various branches of the military within California, this three-volume document provides a methodical and contextual framework to guide future work with an interservice approach. The document provided contextual themes, property types, and registration requirements for various property types found on California military establishments.

1.3.1. Thresholds of Significance

The inventory and evaluation of buildings, structures, objects, and districts on NAS Alameda presented in this report was conducted through application of the significance criteria of the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR). Eligibility for listing in either the NRHP or CRHR requires that a property have both demonstrable historic significance and integrity. Historic significance is established by determining whether or not the property has important associations within the context of a significant aspect of American history, architecture, archeology, engineering, or culture. Properties may be significant at the local, state, or national level. Associations can be with a single historical event, pattern of events, or historical individuals, but such associations must be specific and important. Properties may also be significant for their physical design or construction, embodying distinctive characteristics of a type, period, or method of construction, as the important work of a master designer / builder, or by possessing high artistic value. Furthermore, some properties are eligible because they are part of a significant and distinguishable entity whose components may lack individual distinction. Historic integrity is the ability for a property to convey its significance and is assessed through evaluation of location, design, setting, workmanship, materials, feeling and association. Eligibility for listing a property in the NRHP or CRHR rests on the twin factors of significance and integrity. A property must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will overwhelm historical significance a property may possess and render it ineligible. Likewise, a property may retain integrity, but if it lacks significance, it is ineligible

for listing. The NRHP and CRHP evaluation criteria and their application to resources on NAS Alameda are described in Section 4, along with a summary of the findings of previous evaluation efforts.

The survey of properties on NAS Alameda analyzed NRHP and CRHR eligibility within the applicable contexts, depending on when the buildings and structures were constructed and used. DPR 523 forms recording these buildings and structures can be found in **Appendix C** and are organized by resource name. The pages of **Appendix C** are sequentially numbered. **Appendix B** contains eight separate tables which organize the buildings and structures on NAS Alameda according to different categories. **Table B-1** lists all buildings, structures, and objects surveyed. **Table B-2** lists buildings and structures not recorded. **Table B-3** lists buildings included in the Specific Buildings Evaluation. **Table B-4** lists buildings included in the Cold War Evaluation. **Table B-5** lists NAS Alameda Historic District Contributors, and **Table B-6** lists NAS Alameda Historic District Non-Contributors. **Table B-7** is organized by the name of the resource. Both **Tables B-7** and **B-8** include the sequential page numbers used in **Appendix C** for the DPR 523 forms on which a specific building has been recorded. Application of the NRHP and CRHR criteria included evaluations within the context of the lead up to World War II and the war years (1938-1945), as well as the Cold War era (1946-1989), and considered whether or not any of the facilities built during the latter part of the Cold War era achieved significance within the past fifty years. These evaluations also considered whether or not each building or structure met the significance criteria as an individually eligible property, or as a potential contributing element to the NAS Alameda Historic District. The evaluation of these resources followed the National Park Service guidance, specifically *National Register Bulletin 15*, and the statewide guidance for military properties.[7] The conclusions of the surveys conducted for the Specific Buildings Evaluation and the Cold War Evaluation are presented in Section 5.

1.3.2. Application of Nationwide Section 106 Agreement Documents

Three nationwide Section 106 agreement documents applied to properties located on NAS Alameda and were taken into consideration as part of the evaluation of resources on the station. These agreements that apply to specific resources on NAS Alameda are: the Programmatic Memorandum of Agreement (PMOA) on World War II Temporary Military Buildings; the Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities; and Program Comment for Wherry and Capehart Era Family Housing at Air Force and Navy Bases. These documents provide streamlined methods for compliance with NHPA Section

[7] CFR Title 36, Part 60; *National Register Bulletin 15*, passim; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, California Historic Military Buildings and Structures Inventory (prepared for United States Army Corps of Engineers, 2000).

106 for these specific property types. In each case, the Navy has or is conducting nationwide study and documentation of the properties. Copies of the PMOA and Program Comments are included in **Appendix F**. The buildings and structures on NAS Alameda subject to these documents have been evaluated and documented as directed by each and no further treatment is required. For a full description of each document, please refer to Section 4.

Appendix G includes the Navy's responses to comments from the public and correspondence with SHPO regarding concurrence on the findings of this report.

1.4. Summary of Findings

This report addressed 442 buildings, structures, or objects located on the former NAS Alameda. All of the 442 facilities were evaluated for potential significance within the context of the Cold War (1946-1989). A subset of 105 buildings and structures built prior to 1946 received further evaluation regarding their significance within the context of World War II and potential to contribute to the NAS Alameda Historic District.

In 1992, architectural historian Sally Woodbridge completed a "Historic Architectural Resources Inventory for Naval Air Station, Alameda" that inventoried and evaluated the buildings and structures on NAS Alameda constructed before 1946.[8] Woodbridge identified a potential historic district comprised of 85 contributing buildings and structures built between 1938 and 1945 (38 contributors located in the central core, and 47 contributors located in the officer housing area). The NAS Alameda Historic District, she concluded, met eligibility requirements under Criterion A, for its significance as a World War II-era naval air station under the contextual theme of the development of U.S. Navy bases in the San Francisco Bay Area during World War II, and under Criterion C, for its master planning and its architectural style as an important example of the Moderne style. The district was determined eligible through consultation and concurrence with the SHPO on September 25, 1992.[9] In 1997, the Navy, through further consultation with the SHPO, corrected the number of contributing buildings to account for a total of 49 residences, revising the number of contributing elements from 85 to

[8] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" (1992).
[9] Office of Historic Preservation, "Historic Property Datafile for Alameda County," California Historic Resources Information System, as of December 3, 2004; US Navy, Engineering Field Activity, West, Naval Facilities Engineering Command, "Final Environmental Impact Statement for the Disposal and Reuse of Naval Air Station Alameda and the Fleet and Industrial Supply Center, Alameda Annex and Facility, Alameda, California" (October 1999), 3-63.

87.[10] A fire in 2003 destroyed one contributing building (Building 101), thereby reducing the number of contributors in the historic district to 86.

This study identified thirteen new contributors to the NAS Alameda Historic District, and recommends expanding the historic district boundaries to encompass those resources. See **Figure A-4, Appendix A**. The thirteen new contributing resources in the NAS Alameda Historic District were originally completed in 1940 or 1941. They are the Seaplane Lagoon, Seaplane Lagoon Ramp 1, Seaplane Lagoon Ramp 2, Seaplane Lagoon Ramp 3, Seaplane Lagoon Ramp 4 (Building 200687), Bulkhead (Building 200648), Jetty (Building 200650), Building 5, Building 10, Building 15, Control Tower (Building 19), Building 35, and Building 64. The previously identified and proposed historic district boundaries are described in Section 5 and illustrated in **Figure A-5, Appendix A**. The district, which retains the same period of significance of 1938-1945, now includes at total of 99 contributors and 57 non-contributors (see **Table B-5** and **B-6**, **Appendix B**). None of the pre-1946 buildings and structures so evaluated was found individually eligible for the NRHP or CRHR within the context of World War II.

This report finds none of the 442 buildings and structures evaluated for significance within the Cold War context meet the criteria for individual listing in the NRHP or CRHR under this context. Neither the NAS Alameda Historic District nor its contributors are significant for associations with the Cold War. This report did not identify any other historic district associated with the Cold War.

The NRHP status of resources inventoried and evaluated in this report are illustrated on **Figures A-3a, A-3b** and **A-3c**. **Figure A-4** illustrates the proposed historic district boundary while **Figure 5** illustrates the previous historic district boundary determined by Woodbridge and the proposed historic district (including its boundaries, contributing resources, and non-contributing resources). These figures are in **Appendix A**.

2. HISTORIC CONTEXT: MISSION AND ACCOMPLISHMENTS OF NAS ALAMEDA

The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country in the mid to late 1930s. During World War II, NAS Alameda was effectively adapted to support naval air power, which played a central and crucial role in the Pacific theater. The station grew rapidly to enable it to serve and support important wartime activities. NAS Alameda was one of three major air stations on the west coast to support operations of aircraft carrier groups, patrol squadrons, and utility squadrons, and it conducted critical functions for aircraft assembly and repair. Under the theme of Pre-War Preparedness in the Statewide Study, NAS Alameda is listed among the permanent bases built during the period leading up to World War II. The Statewide Study notes that military facilities like NAS Alameda share characteristics, such as most were constructed in a short period of time and many were built following a "total base design" with adaptations required during rapid war time construction. The Statewide Study also observed that many late 1930s military facilities were built, like NAS Alameda, following construction and architectural trends of the period, many of which included reinforced concrete buildings.[11]

Following naval aviation's successes in World War II, the Navy established the aircraft carrier as a central basis for naval operations, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. NAS Alameda supported carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, and continued to carry out its main function of aircraft overhaul and repair. As noted in the Statewide Study, much of the focus for military development during the Cold War, however, was on research and development of innovative aircraft and weapons. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of Cold War naval missions and activities.

Aerial photographs from 1943, 1945, 1946, 1958, 1968, 1985, and 1993 are provided in **Appendix A** for reference purposes.

2.1. Pre-World War II and World War II

2.1.1. Establishment of NAS Alameda (1917-1940)

Experiments in Naval aviation began as early as 1910 when the first biplane took off from the deck of the cruiser *USS Birmingham* (CL-2). Maneuvers in 1913 illustrated the first uses of Navy aircraft for observation, spotting, and reconnaissance. During this exercise off the coast of Cuba, the entire naval aviation contingent participated in scouting, spotting mines and submarines. Despite the growing usefulness of naval aviation – further demonstrated through the use of seaplanes for anti-submarine patrols in World War I, the 1921 demonstration sinking by aircraft of the former battleship *Ostfriesland*, and successful employment of aircraft in 1923 fleet exercises – funding to expand naval aviation activities was limited during a period of post-war low military spending and as the army and navy debated the merits and control of aviation for military purposes. Naval aviation was bolstered by the establishment of the Bureau of Aeronautics in 1921, which promoted development of integrating aircraft with fleet operations. Available funds for navy aviation were generally spent on aircraft during this period, creating overcrowding at the few facilities that served aircraft, and little money was spent directly on creating naval stations designed for aircraft operations. Two of the earliest naval facilities that had aircraft functions were in San Diego, which was established in 1911 and shared air facilities with an Army air field, and in Pensacola, Florida which was established in 1914 and was an adapted naval yard. Construction in the 1930s would place NAS Alameda on equal footing with these stations.[12]

Increases in Depression-era federal spending during the early 1930s and the growing concerns regarding national defense in response to geo-political changes in Europe and Asia boosted funding for naval aviation. The Vinson-Trammell Act of 1934 helped expand naval aviation activities, providing for acquisition of aircraft to accompany new ships, and the improvement of naval bases. At the same time the military presence in California was growing. Before this time, a majority of military bases were located in the midwestern, southern, and eastern parts of the country. In the 1920s the Navy reorganized into Atlantic and Pacific fleets, spurring the construction of naval facilities in California. California – and the San Francisco Bay Area in

Gross, *American Military Aviation: the Indispensable Arm*, (College Station: Texas A&M University Press, 2002) 48-50.

particular – offered a mild climate and undeveloped land, which was an excellent combination for naval operations and training. In 1935, Navy representatives met with Alameda city officials to discuss purchasing 1,000 acres of low, tidal land west of the city for an air station. The negotiations were successful, and in June 1936 Congress passed Public Resolution No. 19, which authorized President Franklin D. Roosevelt to accept the City of Alameda's offer for the land.[13]

The Navy had long considered the area at the western end of Alameda for naval operations. Beginning in the 1870s and continuing into the early 1900s, the City of Alameda (incorporated in 1872 and re-incorporated as a Charter City in 1884) had experienced significant infrastructure growth, attracted a number of industries, and grown in population. By the 1910s, local businessman John J. Mulvany began promoting Alameda as an attractive site for a military installation. He began pressing the Navy and Congress to establish such a facility at the low-lying area west of the city called Alameda Point.[14] Mulvany's efforts led to the creation of a special congressional fact-finding committee headed by Admiral James Helm in 1917. The subsequent Helm Report, released that same year, recognized Alameda's advantages: local industry and transportation infrastructure, shallow waters to create as many acres as needed through dredging the sandy bay, access to deepwater, and its relatively isolated location. His report recommended that the Navy purchase land at Alameda for development of a supply station, comparable to the facility at Hampton Roads, Virginia that housed and supported Navy aircraft. The Alameda station was to be part of a chain of naval bases along the west coast stretching from San Diego to Seattle.[15]

Despite local support and continued requests from the Navy, Congress did not approve construction of a naval base at Alameda for nearly two decades. In the interim, the City, private interests, and the Army developed parts of what became NAS Alameda. West of Webster Street

Paxson, "The Naval Station at Alameda, 1916-1940: A Case Study in the Aptitude of Democracy for Defense," *The Pacific Historical Review*, Vol. XIII, No. 3, September 1944: 235-250.

in Alameda, the city allowed a private corporation to create 900 acres of filled land and construct an airport along the Southern Pacific Railroad Mole that jutted into the San Francisco Bay from the western tip of the island. This later became the northwest corner of the station. The Alameda Municipal Airport opened in March 1929 (**Photograph 1**). The airport attracted to its facility the Curtis-Wright Corporation. Later, Pan-American Airways flew seaplanes from the peninsula, including the famous "China Clipper" in 1935 that inaugurated commercial trans-Pacific air service. The site of the aircraft's departure is commemorated by California Historical Landmark #968, located near the base flagpole in front of Building 1, although the actual site of the airport bay was to the west near the intersection of Runway 7-25 and the taxiway that connects it to Runway 13-31. Less than two weeks after the completion of the Alameda Municipal Airport, a private venture began construction of the San Francisco Bay Aerodrome on leased acreage in the area bound by Webster Street to the east, present day Atlantic Avenue to the south, and Main Street to the west. The Aerodrome was dedicated in August 1930.[16]

Photograph 1: Alameda Municipal Airport 1936. [17]

During that same year, the Army began building its own airfield, Benton Field, on 128 acres of what had been partially submerged lands between the San Francisco Bay Aerodrome to the east and the Alameda Municipal Airport to the west. The Army dredged and infilled 100 acres in the

[16] Paxson, "The Naval Station at Alameda, 1916-1940: A Case Study in the Aptitude of Democracy for Defense," *The Pacific Historical Review*, Vol. XIII, No. 3, September 1944: 245. The Navy later used the Airdrome property and this area east of Main Street was an annex to the NAS Alameda station. Most of the former annex / Airdrome property has been transferred out of Navy control and is not addressed in this report.

[17] Alameda Airport- Sunnyvale, Calif., proposed seaplane base, December 18, 1936, California - Alameda -pictures, maps, justifications, RG 5, CEC/Seabee Museum, NBVC, Port Hueneme.

area that became the northeast corner of the air station (**Illustration 1**). With the assistance of the Works Progress Administration in 1935, the Army constructed roads, railroad spurs, utilities, a small runway, and well in the area now occupied by the administrative core of NAS Alameda.[18] None of the facilities associated with these early aviation activities remain on station.

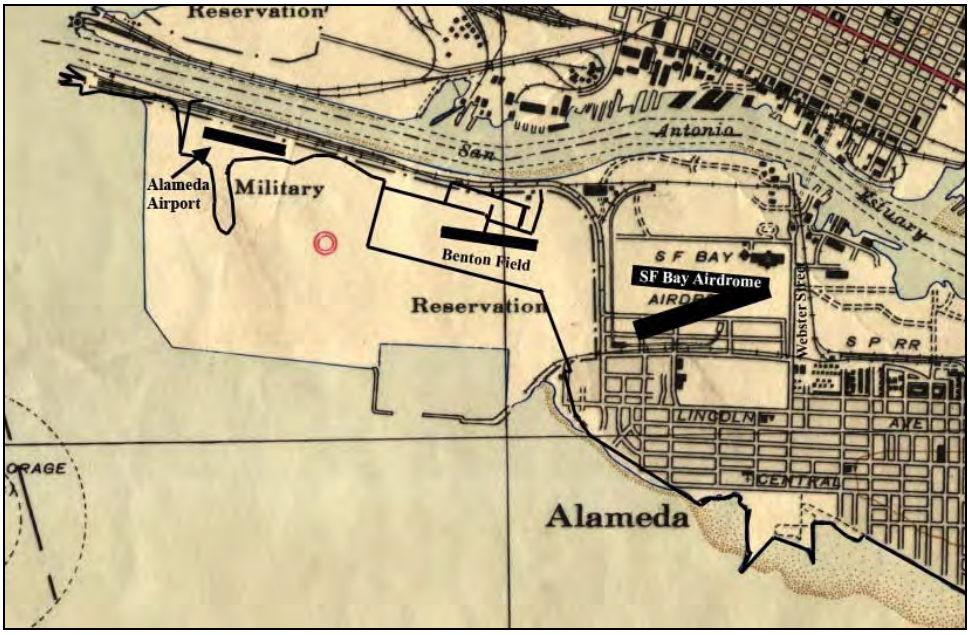

Illustration 1: 1942 USGS Map with circa 1938 location noted of Alameda Airport, Benton Field, and San Francisco Bay Airdrome. The original shore line is outlined in black.[19]

The Navy acquired the Alameda Municipal Airport in June 1936 and obtained the unfinished Benton Field from the Army in October 1936, with authorization the following year for the Navy to spend what the Army would have spent for their air base. More than 2,000 acres of the acquisition was submerged or was fill. Natural land west of Main Street, that was to become part of NAS Alameda and was originally part of the Mexican-era Peralta land grant, was privately owned at this time and subsequently acquired / leased. Congress appropriated $15 million for

[19] USGS, *Oakland West, Calif*, 1:62,500, topographic map, 1942; Ace and Judy Campbell, *Map of Alameda Airport, Benton Field, and San Francisco Bay Airdrome, circa 1938*, Waterfront Action, www.waterfrontaction.org/history/55_lagoon.htm (accessed July 2010).

the construction of a facility at Alameda to support naval aviation in 1937, but Pan-Am required time to move from Alameda Municipal Airport, and so did the Army from Benton Field, delaying commencement of construction for the new naval air station.[20]

Meanwhile, as military tension around the world increased, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur Japay Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. Its work, set forth in the Hepburn Report of 1938, directed Navy expansion. Among its recommendations was the establishment of three types of naval air facilities: 1) major air stations with the ability to assemble and maintain aircraft, along with management of regular operations; 2) secondary stations designed only for regular operations; and 3) training stations. The Hepburn Board boosted the status of the new navy property in Alameda by recommending establishment of NAS Alameda as one of the major air stations on the west coast supporting both operations and aircraft assembly and repair (A&R). Major stations could accommodate two to four carrier groups, three to six patrol squadrons, and two utility squadrons. The plan called for NAS Alameda to support two carrier groups (with possible expansion to four carrier groups) and five patrol squadrons, along with functions to perform aircraft overhaul.[21] NAS Alameda was one of six major naval air stations that the Hepburn Board recommended for construction. The other stations included NAS Norfolk (Virginia), NAS San Diego (North Island), and NAS Seattle (Sand Point), which were already in use for naval aviation activities, and were expanded in response to the Hepburn Report. NAS Alameda, along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program, although Congress had already approved funding for NAS Alameda. The design and construction of NAS Alameda occurred at the same time as NAS Jacksonville and NAS Quonset Point. The assertive conclusion of the Hepburn Report was that the need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning.[22]

2.1.1.1. Station Planning and Design

The Navy's Bureau of Yards and Docks (BuDocks), Department of Planning and Design, designed the station with civilian architects, engineers, and planners under the direction of Captain Thomas Trexel. In general, plans for the station's design followed hierarchal and organizational planning doctrines used for military bases and naval air facilities of the period and that had evolved during the early twentieth century. Plans for NAS Alameda – drafted during peacetime – envisioned a 1,000-personnel facility that would house 200 aircraft and serve as home port for two aircraft carriers. Because early military aircraft were shipped in parts for on-site assembly, the station's original plans featured an A&R Department. The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[23] The station's original design received an award for functional planning at the Seventh Annual Architectural Exhibition of the Association of Federal Architects in Washington D.C. in 1939.[24] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. BuDocks and the design team utilized standardized designs for some building that we developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. Following the Hepburn Report, BuDocks and BuAer further refined standards and requirements for naval air stations. However, local conditions necessitated alterations for improved functionality at given

for the Naval Air Station Alameda Historic District" (prepared for Naval Facilities Engineering Command, Southwest and Base Realignment and Closure Program Management Office West, January 2008), 8; and LCDR. locations.[25] NAS Alameda followed many of the standards and requirements of the period. Yet, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report.

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period planners located piers, seaplane functions, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. As a result of this organization, naval air stations designed and built in this period share similar organization. This can be seen in the comparison of the general layout of NAS Alameda and NAS Jacksonville, both designed and built in the years starting in the late 1930s (**Illustration 2** and **Illustration 3**). Landing areas for both land and seaplanes are at the edges of the base. Hangars, both seaplane and landplane, adjoin the landing areas. The A&R facilities are within easy access of both types of hangars. On the opposite side of A&R from the hangars are the storage and materials areas. Administrative functions are placed at the center of the station, between the operational areas and residential areas. Enlisted quarters are closest to the work areas so that enlisted personnel could easily access their assigned duty. Officers' and family quarters were placed further from the operational activities of the stations. Enlisted and officers each had their own recreational areas. For safety, hazardous materials and ordnance were furthest from the residences, some of which were on the landing fields. The location of natural features relating to the docks and seaplane facilities determined the final placement of this interlocking system of activities. Important to the master planning was consideration of future expansion, which led some areas to be left undefined in initial plans for station, such as the area east of the Seaplane Lagoon on NAS Alameda.[26]

Early plans for NAS Alameda show a station arranged along intersecting axes and divided into functional areas, although without details that would emerge during the station's early years. In the early plans from 1939 the north-south axis ran from the main gate bisecting the mall and the Administration Building (Building 1) with an east-west axis dividing the administrative / residential area on the north side of the station with the industrial and operations on the south

side. This east-west axis was an open area that was to align with the middle of the airfield on the west end of the station, with landplane hangars flanking this axis. There was also another east-west axis in the original plan that bisected the Bachelor Enlisted Quarters (BEQ) area (Buildings 2, 3, and 4) and crossing the north-south axis in the middle of the mall in front of Building 1 and along the median of what is now West Essex Drive. The BEQs with their Galley / Mess Hall (Buildings 2, 3, and 4) were shown in their current location. Bachelor Officers Quarters (now Building 17) were to be two mirrored buildings facing a central green space similar to that of the enlisted quadrangle. Officers' family housing was the only non-axial portion of the station, planed as an irregular loop in the northeast corner. The original A&R facility (Building 5) was planned at half its eventual size and the location of several functions were not yet assigned, such as much of the recreation facilities and some of the residences. Early plans for station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, locomotive repair shop, paint / oil storage, and engine test cells.

Functional and departmental requirements led to specific siting of some facilities and changes in the station's design and plans during the planned phased construction of the new station. The landplane hangars were repositioned parallel to the airfield and aligned with a secondary axis, and later the open space along the original east-west axis was filled with additional buildings. Placing the additional buildings in that space situated them near the industrial and storage facilities thereby maintaining functional efficiency. The axis from the BEQ quadrangle across the mall stretching to the officers housing area thus received prominence (see Cultural Landscape Report for further discussion of station layout). Almost all of east side of the station, and its temporary type construction, emerged only with the demands of war. Despite these changes, the evolution of the station's layout during both the initial years of construction prior to US entry into World War II and during the war left intact much of the station's original planning and its important principles of organization, functionality, efficiency, and hierarchy, adapting well to the enormous demands of war. The initial plans for a 1,000 personnel facility evolved during the war to 18,000 Navy personnel and 9,000 civilians working on the station (**Illustration 3, Illustration 4, Photograph 2, Photograph 3**, **Photograph 4,** and **Photograph 5**).[27]

2.1.1.2. Construction of NAS Alameda

The construction of the air station began in February 1938 under the supervision of Commander E.C. Seibert of the Civil Engineer Corps. Working from a small shack, Seibert administered contracts to 25 companies for demolition of extant buildings and structures on site, dredging submerged land, and construction of the new facility. The grounds of the station were scarified in preparation for filling and grading, and fill was obtained through dredging the future sites of the ship channel, turning basin, and Seaplane Lagoon. Before dredging took place, a stone rip-rap seawall was constructed in order to contain the fill and help convert submerged and partially submerged lands. A suction dredge then drew silt from the three sites and deposited the material

[34] Aerial photograph of NAS Alameda, 1948, Box 1, RG 10, CEC / Seabee Museum, NBVC, Port Hueneme.

on tidal flats and marshes located within the seawall. More than 15 million cubic feet of fill was ultimately used to build the station.[35] **Photograph 2** and **Photograph 3**, taken in January and November of 1941, respectively, show the progress of the fill. Once crews completed filling and grading, underground utility installation and building construction began.

The following buildings (that are still extant) were constructed in the following order:

- Building 90 (Employment Office / Garage; not in current location)
- Building 1 (Administration Building)
- Building 2 (Bachelor Enlisted Men's Quarters, seven wings)
- Building 3 (Mess Hall partial)
- Building 18 (Post Office / Theater)
- Building 6 (Public Works Garage and Firehouse)
- Building 5 (Assembly and Repair Shop, partial)
- Building 10 (Power Plant, partial)
- Building 8 (General Storehouse, partial)
- Building 9 (Aircraft Storehouse, partial)
- Building 13 (Paint and Oil Storage, partial)
- Building 14 (Engine Test Stands, partial)
- Buildings 11 and 12 (Seaplane Hangars)
- Buildings 20, 21, 22, and 23 (Landplane Hangars)
- Building 19 (Operations Building / Control Tower, partial)
- Building 15 (Boathouse)
- Building 17 (Bachelor Officers' Quarters, partial)
- Ten Married Officers Quarters [36]

The Navy phased construction of buildings at the station. Individual barracks, mess halls, and operational buildings were constructed in increments, with planned expansions. For example, only seven of the ten wings of Building 2 and two of the three mess halls in Building 3 were built in 1939. Building 4 and the third mess hall were shown on base plans, but construction and contracts were phased to allow growth in operations. Site plans and blueprints indicate that the General Storehouse (Building 8), Aircraft Storehouse (Building 9), Paint and Oil Storehouse (Building 13), Engine test cells (Building 14), and Bachelor Officers' Quarters (Building 17) were similarly phased. Additional locations for hangars were also indicated on the initial plans.

[35]Naval Air Station Alameda, *U.S. Naval Air Station Alameda, California* (Baton Rouge, LA: Army and Navy Publishing Company of Louisiana, 1945) np; Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 3.

[36] US Navy, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Dec 44," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, RG 181, NARA (San Francisco).

Building 90 was moved several times during the station's history. It is currently located near the East Gate, and was most recently home to the Civilian Employment Office; it was built in 1938 as a garage. Building 1, the Administration Building, was completed in November 1938. By early 1940, many of other buildings were under construction – including Buildings 11 and 12, the seaplane hangars north of the lagoon.[37]

The construction of the Seaplane Lagoon and two of the seaplane hangars prior to building landplane hangars and airfield indicates the relative importance for the Navy, at the time, of seaplanes or 'flying boats' (see **Photograph 6**). These aircraft lacked the speed and maneuverability of land-based aircraft, but were excellent patrol, rescue, and transport craft. Prior to the widespread use of radar, patrol aircraft located targets for their assigned ships. Seaplanes moved slowly, but could stay aloft for long periods covering large areas of oceans. Their ability to land on water made it possible for them to search for, and rescue, downed aviators and sailors. The large boat hull allowed them to transport materials to locations inaccessible to other aircraft. Each of the air stations established or improved under the Hepburn Board plan included seaplane facilities. The Seaplane Lagoon on NAS Alameda was formed by dredging rather than utilizing a natural feature. Seawalls for the lagoon were formed with two sizes of rock and backfilled with dredged materials in two stages.[38] Construction of the lagoon was integral to the dredging operations and it was largely complete by 1940, when the first of the seaplane ramps were installed.

The Navy also planned and developed much of the landscape of the station. Initial plans for NAS Alameda did not include a designed planting plan; however, the need to vegetate the newly created land quickly became apparent to those living and working on the station. Because this end of Alameda was largely marshland and the station had been built on fill, it was susceptible to soil movement and erosion. Blowing winds created dust-storms that were abrasive to machinery, and also made it difficult to maintain acceptable standards of cleanliness for a military installation. To alleviate the situation, in 1940, Johnson, Drake, and Piper contracted Emery A. LaVallee, to design a planting plan for NAS Alameda that would cover the open areas of the

Wragg, *Boats of the Air: An Illustrated History of Flying Boats, Seaplanes and Amphibians* (London: Robert Hale, 1984), 70, 73, 102, 160; Bureau of Yards and Docks, "US Naval Air Station Alameda, Bulkheads, Jetties, Seawall, Dredging and Filling, Location Plan and Sections," Yards and Docks #125969, December 29, 1937, Drawer A-11 Pier no. 1 Brows-Camels, Plans and Maps Room 143, Building 1 on former NAS Alameda, Alameda, California.

station with vegetation. (Please see Cultural Landscape Report for discussion of the execution of the planting plan and changes over time.) In 1941, the Navy contracted with the Golden Gate International Exposition, then on Treasure Island, to relocate vegetation, including ice plant, grasses, trees, and shrubbery, from the fair when it ended. The Navy also obtained plants from the California State Forestry Division. The Navy planted trees and shrubs along the mall between the Main Gate and Building 1, in the BEQ quadrangle, as well as elsewhere on the station as needed (**Photograph 7**).[39]

The beginning of hostilities in Western Europe in September 1939 stimulated the Navy to quicken the pace of construction on NAS Alameda. In July 1940, a month after Germany invaded France, Belgium, and the Netherlands, Congress approved an additional $17 million for work on NAS Alameda. Johnson, Drake & Piper Construction Company was awarded the major contract to hasten the station's completion. The company, with main offices in Minneapolis, Minnesota and satellite offices around the nation, secured military construction contracts across the country and overseas during World War II. Whereas the Navy previously issued contracts for individual buildings or structures, Johnson, Drake & Piper's contract covered 35 items. Additions to the contract continued through 1942, and as a result Johnson, Drake & Piper was responsible for constructing most of the station.[40]

As noted above, the Navy altered the original 1939 plans as construction progressed. Plans for the land plane hangars (Buildings 20, 21, 22 and 23, constructed 1941) shifted them from facing the east-west axis to a row along the western edge of the station, facing the airfield. Additional support functions were added along the eastern side of the Seaplane Lagoon, including the initial Engine Test Cells (Building 14) and Paint and Oil Storage (Building 13), both of which were likely sited to be adjacent to the railroad lines and away from the densely occupied areas of the station. It was during this period that the decision had been made to not proceed with the station's initial open area east-west axis and to use that space for necessary buildings, including the Weapons Shop (Building 43), and to emphasize the east-west axis across the BEQ quadrangle and the Administrative Building's mall (see **Photograph 5**).

Other changes to the station's plan involved housing. Housing evolved as part of naval base planning during World War I, before which sailors were expected to live on board their ships, and few facilities were provided for enlisted men or officers. The introduction of naval air stations and other new facilities not tied directly to ships and shipyards during the 1920s and 1930s required the inclusion of housing because personnel could not be housed shipboard. This concept expanded by the 1930s providing not only officers, but also top grades enlisted men, with married housing. The Navy later extended the policy to all enlisted families.[43]

Early plans for NAS Alameda included barracks for enlisted men in Buildings 2 and 4, Officers' Housing in the northeast corner, a small cluster of Chief Petty Officer housing, and two Bachelor Officers' Quarters. The Officers' Housing (**Photograph 8**) was originally a single curvilinear loop with a more natural feel than the formal rectilinear plan of the rest of the station. The streets in this area were also offset from the streets in the rest of the station (see **Illustration 3**). As the station plan was modified through 1939 and 1940 the footprint for the officer's housing area became more of a smooth oval divided by gently curving streets (**Photograph 2**). Seventeen Chief Petty Officer units were added to the first 13 expanding the station eastwards. These additions expanded on the housing that had been roughly envisioned in the original plan. However, alterations to the Bachelor Officers' Quarters (Building 17) begun in 1940 did alter the station plan. In 1939 the Bachelor Officers' Quarters were designed as two buildings mirroring each other across an open space that ran along the axis extending eastward from the quadrangle between the BEQs (Buildings 2 and 4). The footprint of the Bachelor Officers' Quarters changed through 1939, but the 'mirrored' idea remained (see **Illustration 3**). Construction of the southern building (Building 17) began in early 1940. By September 1940, designers developed a new plan and Building 17 began to develop the four wings it has today. Construction was phased through 1941, adding wings as additional staff arrived on station (**Photograph 3** and **Photograph 9**). The second Bachelor Officers' Quarters building, (shown in **Illustration 3** north of Building 17) was never constructed; instead as wartime necessities demanded, the Navy installed temporary wooden buildings (including Buildings 135 and 137) opposite Building 17 in 1944 and 1945 (**Photograph 10**).[44]

On November 1, 1940, although still incomplete, NAS Alameda was commissioned and placed under the command of Captain Frank R. McCrary, with Rear Admiral A.J. Hepburn in attendance at the opening ceremony. The new base was expected to boost the local economy, but few expected the station to become as large as it did as a consequence of World War II. In February 1941, three months after the base opened, the author of an article appearing in the *Alameda Times-Star* speculated that nearly 800 local residents would work on NAS Alameda. The paper could not have anticipated that by the end of the war the thousands of military and civilian personnel stationed and working on the facility. The station's opening also prompted the creation of a number of on-base trade schools for aircraft maintenance, including the Aviation Metalsmiths' School, the Aviation Machinist Mates' School and the Aviation Radiomen's School. These training centers educated civilians as well as enlisted personnel in Building 132 (since demolished) near the enlisted pool.[48]

The first operational aircraft, a squadron of seven seaplanes, arrived in January 1941 along with the seaplane tender ship *USS Pelican*. These were the first of 200 aircraft to be assigned to the station.[49] This squadron was able to operate from the completed Seaplane Lagoon, while dredgers were forming the land for runways. Dredging to create the runways continued until September 1941 although runway construction began on the filled land in April (see **Photograph 2** and **Photograph 3** above).[50]

The A&R Department was located in the then 204,000 square-foot Building 5, and its first task was to overhaul a dual-winged, single propeller SCO "Scouter" airplane. By the end of 1940, there were 175 personnel working in the department; a year later, there were 2,000. This building went through multiple expansions throughout the war, the largest of which came near the end of the war with construction of Building 5A.[51]

2.1.1.3. Architectural Design on NAS Alameda

In addition to the careful master planning for the station following principles of organization, functionality, hierarchy, and efficiency, the Navy also designed prominent buildings on the station in a manner that corresponded with the efforts to create a modern and organized facility. This was achieved by adhering the station's plan to a Beaux Arts formal spatial layout and by designing most of its prominent buildings in the Moderne style, which blended neo-classical proportion, symmetry, and order with modern design concepts of the time.[52] The planning and architecture on NAS Alameda demonstrate trends which BuDocks designers drew upon related to campus planning, modernistic design, and the continued traditional architectural expressions of federal buildings during this period.

The NAS Alameda station plan had a comprehensive aesthetic design based on the Beaux Art planning used in City Beautiful planning. The City Beautiful movement heavily influenced planning in the United States in the first half of the twentieth century, and can be seen in city planning as well as institutional settings such as college campuses. The movement borrowed

[51] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot at Alameda, California," 4; Naval Air Station Alameda, *U.S. Naval Air Station Alameda, California* (Baton Rouge, LA: Army and Navy Publishing Company of Louisiana, 1945), np.
[52] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, such as those employed on NAS Alameda. Various *partis* or shapes, such as courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. Important local examples of Beaux Arts plans include the Civic Center of the City of San Francisco built after the 1906 earthquake, the Pan Pacific International Exhibition (San Francisco) in 1915, and the Golden Gate Exhibition on Treasure Island in 1939. Early development of the campus for the University of California in Berkeley was also influenced by Beaux Art design. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. In many nineteenth century and early twentieth century examples of such plan, the buildings were also in the Beaux Arts style with Classically-derived ornamentation, but as styles evolved, buildings constructed on such plans were of a variety of styles, including the developing Moderne style used on NAS Alameda. The US military had employed Beaux Arts inspired plans on select bases in California and across the country since World War I and continued to use such plans throughout the period between the two wars.[53]

At the same time Beaux Art and City Beautiful planning remained popular and prominent in civic and military design, architects worldwide began to abandon historical revival styles during the late 1920s and especially during the 1930s in favor of designs that consciously illustrated modernity and technological progress using simplified geometric forms and ornamentation. This trend developed mostly from European modernistic art and industrial design, but transferred to architecture wherein it presented sleek and spare designs. Often buildings designed in the new style(s) of the period, such as prominent buildings on NAS Alameda, retained proportion, symmetry, and order found in buildings inspired by Classical architecture, but without direct allusion to historical styles. Materials such as concrete, metals, and glass block – all of which were used on NAS Alameda – were prominently used to illustrate a directness regarding building fabric to help portray the machine / technological-inspired aesthetic. The "modern" architecture of the time evolved through various phases and has been called by several names. Art Deco was the earliest phase. Its buildings often emphasized verticality and included intricate geometric ornamentation like stylized floral decoration or patterns such as chevrons. Prominent nearby examples include the Paramount Theatre on Broadway in Oakland. Many of the major buildings at the Golden Gate International Exposition on Treasure Island held in 1939-1940 were also in the Art Deco style. This was followed by Moderne (also referred to as Art Moderne or Streamline Moderne) that was less ornamental than Art Deco. As seen on the nearby Alameda

[53] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320.

Theater on Central Avenue in Alameda and on NAS Alameda, it expressed modernity by using curving wall surfaces and columns with highlighted simplified geometric ornamentation such as the wall panel striations (**Photographs 11** and **12**) and stylized Pegasus and eagle figures in the BEQ area (Buildings 2, 3, and 4) (**Photographs 11** and **13**). Aspects of the station's Moderne design were also implemented on operational buildings, such as the hangars, the designs of which included broad rectangular corner piers with decorative horizontal bands running from pier to pier across the façade, long industrial steel sash windows, and prominent copper flashing / roofing (**Photograph 14**). The International Style was also evolving during the 1930s, striving to create an aesthetic purposely devoid of any ornamentation in favor of highlighting efficiency in design as well as material and functional honesty. The three terms apply to the early modern architecture in the United States. Art Deco and Moderne were most prominent prior to World War II and International Style ascended to prominence following the war, as seen in the Ordnance & Optical Shop at Hunter's Point Naval Shipyard (built in 1948) and in the Oakland and San Francisco skylines of the 1950s and 1960s.[54]

The rapid evolution of aviation and other forms of transportation during the 1920s and 1930s particularly inspired designers to illustrate in architecture and industrial design modern society's departure from the past that was seemed apparent, or was being sought, at the time. The expansion of civilian and military aviation was symbolic of modern technological achievement and streamline forms appeared in, and influenced the design of, seaplane and landplane aircraft as well as in the buildings of the growing nationwide network of civilian airports. The airport in Long Beach, California built in 1941 is a well known example of a civilian airport built in the Moderne style. Other examples include the Washington-Hoover Air Terminal in Washington, D.C. and the Swan Island Airport in Portland, Oregon, both of which were built in the late 1920s, Dinner Key Terminal in Miami, Florida built in 1934, and the Marine Air Terminal that became LaGuardia Airport in New York built in the late 1930s.[55] This design trend may have influenced design decisions BuDocks made for its new aviation facility at Alameda.

[54] The development of Art Deco and Moderne is discussed in many general works on American architectural history and guidebooks of San Francisco Bay Area architecture, including: Sally B. Woodbridge, *California Architecture: Historic American Buildings Survey* (San Francisco: Chronicle Book, 1988); Carla Breeze, *American Art Deco: Architecture and Regionalism* (New York: W.W. Norton & Company, 2003), 9-33 and 222-277; Mark A. Wilson, *A Living Legacy: Historic Architecture of the East Bay* (Lexikos, 1987), 42, 56, and 59; David Gebhard and Harriette Von Breton, *Los Angeles in the Thirties: 1931-1941*, 2nd edition (Los Angeles: Hennessey & Ingalls, Inc, 1989), 75-91; David Gebhard, Eric Sandweiss, and Robert Winter, *Architecture in San Francisco and Northern California*, (Salt Lake City: Gibbs-Smith Publisher, 1985), 576-579. For discussion of International Style Modernism in Northern California see: Pierluigi Serraino, *Icons of Northern California Modernism* (San Francisco: Chronicle Books, 2006).

Architects working on Federal contracts during the 1930s developed a "style" that sought to maintain form, symmetry, and organization of the classical traditions that had guided Federal design since the early years of the Republic, but which drew upon the evolving modern styles of the decade that were increasingly popular in private construction. Various architectural historians have attempted to develop a specific name for this style, including "Starved Classicism" and "PWA Moderne." The latter of these terms denotes the use of the style for buildings constructed from the Public Works Administration program, such as the Alameda County Courthouse in Oakland.[60] This is the style of the NAS Alameda Historic District, particularly in the Administrative Core area. The style is found throughout California, particularly in the dozens of post offices built during the 1930s.[61] The style was rarely used, however, in the design of military buildings in the state, and as a result they are treated as their own property type within the Statewide Study as "Concrete, Art-Deco Influenced Permanent Base Designs."[62] In California, there appear to be only two other examples of this style on military bases or buildings. One – another Navy-owned property – is the Naval and Marine Corps Reserve Center in Los Angeles. The other property, most comparable to NAS Alameda, is McClellan Air Force Base near Sacramento. The Reserve Center was designed by a private architect, Stiles O. Clements, while the buildings at McClellan AFB were designed directly by the Quartermaster Corps, at the time the Army's equivalent of the Bureau of Yards and Docks.[63]

BuDocks' efforts to pursue modernistic design trends in the late 1930s and early 1940s was noted in design literature at the time and celebrated on NAS Alameda soon after the station's construction. BuDocks and NAS Alameda are highlighted in an issue of *Architectural Forum* from November 1940 that presents the growing demand in military construction for national defense during the buildup prior to the United States' entry into World War II. The "Naval Air

[60] See, for example, Lois A. Craig and Staff of the Federal Architecture Project, *The Federal Presence: Architecture, Politics, and Symbols in U.S. Government Building* (Cambridge, MA: MIT Press, 1984); David Gebhard, et al, *A Guide to Architecture in San Francisco & Northern California*, (Santa Barbara: Peregrine Smith, Inc., 1973); David Gebhard, Eric Sandweiss, and Robert Winter, *Architecture in San Francisco and Northern California* (Salt Lake City: Gibbs-Smith Publisher, 1985). The Alameda County Courthouse was featured in the PWA publication: C.W. Short and R. Stanley-Brown, *Public Buildings: Architecture under the Public Works Administration, 1933-1939* (New York: A Da Capo Paperback, 1939, republished 1986), 62-63.

[61] Some of the best examples of this federal PWA Moderne / Starved Classicism style (also referred to as "Stripped Classicism) are found in Los Angeles, as discussed in David Gebhard and Hariette Von Breton, *Los Angeles in the Thirties, 1931-1941* (Los Angeles: Hennessey & Ingalls, 1989).

[62] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-43 – 7-44.

[63] Stephen Mikesell, JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" (prepared for Engineering Facility, West, Naval Facilities Engineering Command, San Bruno, 1997), 7-8; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, California Historic Military Buildings and Structures Inventory (prepared for United States Army Corps of Engineers, 2000), 7-47.

Station, West Coast," as NAS Alameda was labeled, was featured in a two-page photograph spread (see **Photograph 13**) and touted as representing the "forward-looking trend in naval building." The article went onto to point out BuDock's exceptional efforts to create efficient designs following modernistic design trends, especially for standardized officers housing, rather than following the traditional architectural expressions of Colonial Revival or Spanish Revival for housing seen elsewhere on military facilities.[64] The proposed standardized designs illustrated have remarkable similarities to the officer housing on NAS Alameda (**Illustration 5** and **Photographs 15** and **16**). As previously noted, the station's original design received an award at the Seventh Annual Architectural Exhibition of the Association of Federal Architects in Washington D.C. in 1939. One description of that award stated that the prize was for BuDock's design that combined "modern architectural beauty and simplicity of line with maximum effect."[65] Furthermore, a few years after the station's construction, the Navy boasted about the modernity of its facilities in the station newspaper, observing several aspects of the design that contribute to its Moderne character. The BEQs and their quadrangle were noted for their symmetry, "classic lines," and "wide and circular arcade" that was "a pleasing study in squares and curves." The effect was promoted as being "modern in every respect."[66]

Alameda was not the Navy's only naval air station that was designed in the Moderne style. Both NAS Jacksonville and NAS Quonset Point, the other two naval air stations newly built in response to the Hepburn Report, also had multiple buildings constructed using architectural language similar to NAS Alameda (**Photographs 16, 17, 18,** and **19**). The BuDock designs for Alameda may have influenced the architecture on Jacksonville and Quonset Point, as well as influenced the work toward standardized officers housing illustrated in *Architectural Forum*. No specific documentation identified for this report links the three stations architecturally, but available photographs and plans show there were distinct similarities that were even continued by private architect Albert Kahn for his designs on Quonset Point, albeit in brick rather than concrete. The implications of the similarities, along with the BuDocks design trends noted in *Architectural Forum*, are that the Navy was purposely employing modernistic designs as part of their expressed efforts to enhance efficiency and functionality at its new naval air stations in the late 1930s and early 1940s.

2.1.2. World War II (1941-1945)

The demands on naval aviation during World War II transformed NAS Alameda dramatically, requiring the new station to adapt to increased demands and an expansion of its capability. This resulted in additions to and alterations of the station's original design, particularly in the intentionally unplanned, secondary spaces. Although adjustments to the original plan were necessary to accommodate wartime mobilization, the primary elements of the plan – axial layout, spatial relationships, land use, circulation pattern, and sightlines – remained generally unaltered from the original execution of the plan during the initial phase of construction. The Navy greatly tightened security following the attack on Pearl Harbor on December 7, 1941, and erected weapons positions and defensive works. In the course of the war the station became the homeport to 23 ships, 22 air squadrons, and 1,500 aircraft. Air traffic on NAS Alameda increased, resulting in creation of auxiliary and outlying fields elsewhere in northern California and in Nevada to handle excess air traffic. NAS Alameda had a three-fold mission: assembly and repair of aircraft; supply; and aircraft operation and training.

NAS Alameda's contributions to the war effort were not limited to support activities, with many operations in the Pacific theater originating from the station. In March 1942, the famed mission led by USAAF Lt. Col. James "Jimmy" Doolittle against Japan departed for combat from Alameda. No facilities on NAS Alameda were built specifically in support of this well-known mission, but sixteen Army Air Corps B-25 Mitchell bombers were loaded aboard the carrier *USS Hornet* (CV-8) under strict secrecy at the naval station's Pier 1 or 2, and on April 2 departed for the Sea of Japan. A little over two weeks later, on April 18, 1942, Doolittle's Raiders attacked Tokyo, Nagoya, Osaka, and Kobe, scoring a symbolic, psychological, and by some interpretations, a strategic victory against the Japanese early in the war.[69] This event is commemorated with a Native Sons of the Golden West plaque placed at the foot of Pier 3 (constructed in 1945, after the raid).

Throughout the war, one of the station's essential missions was to repair and maintain aircraft. The A&R Department experienced the most growth of any station department during the war. Its central facility was Building 5, which was enlarged by a factor of five between 1941 and 1945; by war's end, it was more than a million square feet. The department became organizationally more complex, dividing into nine divisions (Aircraft Overhaul, Engine Overhaul, Accessories, Metal and Machines, Radio-Radar, Engineering, Planning, Maintenance, and Personnel) located in Building 5 and in several adjacent buildings (**Photograph 20**).

[69] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 6; Naval Air Station Alameda, *U.S. Naval Air Station Alameda, California* (Baton Rouge, LA: Army and Navy Publishing Company of Louisiana, 1945), np.

Photograph 20: A&R operations included a variety of aircraft as shown in this ca. 1945 photograph.[70]

Over the four years of American involvement in the war, department personnel assembled, modified, overhauled, and shipped more than 24,000 aircraft, an average of approximately seventeen per day. A&R's work included not only aircraft assembly and repair, but also life raft and parachute repair, and custom manufacturing of parts. Naval personnel and station employees tested new materials and processes, including welding Plexiglas, and pioneered new techniques, such as aircraft preservation (**Photographs 20** and **21**).[71]

Many of these developments were the result of a Navy-wide Beneficial Suggestions program that operated throughout the station's history. The Navy provided financial awards for time-and money- saving suggestions and inventions.[72] One A&R employee, who had been a steel worker on high rise buildings, had his time-saving procedure approved whereby aircraft were parked

very close together so that he could move between aircraft by walking across the wings from one to another. This saved time from having to climb down from one and climb back up the next.[73]

Photograph 21: Representative image of A&R Department at work ca. 1945.[74]

Assembly and Repair would not have been functional without the Supply Department, established on station along with A&R in 1940. It managed purchase and inventory control of aircraft and parts for A&R, aviation supply for forward overseas stations, and station supplies for the exchange, mess halls, and cafeterias. As NAS Alameda's operations expanded, the Supply Department also provided material for the system of outlying fields and auxiliary fields that provided safe landing and operational bases for patrol and carrier squadrons attached to NAS

[73] Marilyn York, former member of the WAVES (1943-1945) and civilian employee (1946-1976) on NAS Alameda, oral history interview with Christopher McMorris and Cheryl Brookshear, JRP Historical Consulting, LLC, December 8, 2009. Ms. York worked in aircraft repair in Building 5 during World War II.

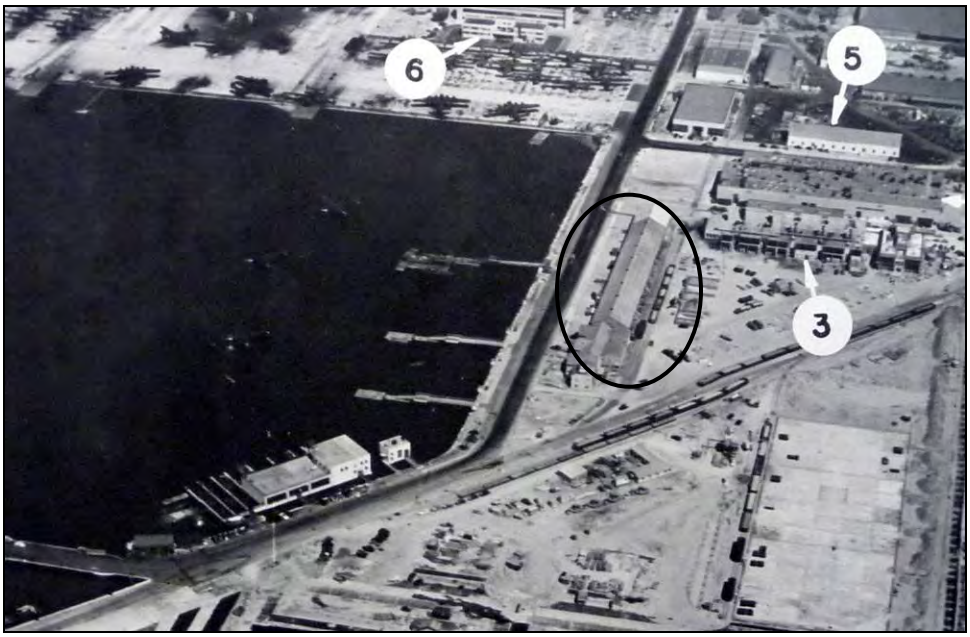
Alameda.[75] In 1941 the supply staff grew from 50 to 100 and its materials on hand increased from several hundred items to over 20,000. During the first year of the war the department received over $1.5 million worth of materiel a month and doubled in physical size. Tons of equipment were accepted and shipped from NAS Alameda and sent to the Pacific theater. To support this activity the supply department began warehouse operations in Building 105 (since demolished) along the east side of the Seaplane Lagoon in 1940 (**Photograph 22**).[76] As the station became overseer for auxiliary air fields in 1942-43 the demands on the Supply Department expanded even further. Physical space increased another 61 percent, the number of items maintained grew to 200,000, and overseas shipments increased 106 percent.[77]



Photograph 22: Building 105 (circled), lagoon side supply warehouse, 1945. (Numbers from original photo identification.)[78]

The entry of the United States into World War II required the Navy to open the runways on NAS Alameda before they were completed. While the system of five runways was not finished until November 1942, it began operations in December 1941.[79] The Navy installed weapons

magazines around the edge of the airfield, keeping hazardous items away from other station activities.

Patrol Wing (PatWing) 8 was transferred to NAS Alameda from Norfolk, Virginia on December 15, 1941. This unit is an example of the units that used the station, and illustrates the typical function of aircraft assigned to the station throughout its history. PatWing 8, later designated Fleet Air Wing (FAW) 8, assisted in training new squadron personnel to operate a variety of land- and sea- based aircraft in the Pacific theater. Training included aviators and support crews. The wing also undertook combat escort duties for the other functional air units on NAS Alameda.[80] The Navy established Air Transport Squadron 2 (VR-2) on NAS Alameda in April 1942 as a part of the Naval Air Transportation Service (NATS). The squadron operated PB2Y *Catalina* aircraft and delivered supplies, personnel and equipment across the Pacific, escorted by FAW-8. Seaplanes like the PB2Y *Catalina* played an important support role in the Pacific, delivering needed material to personnel and facilities on islands too small for standard runways or with bomb-damaged runways. The increasing tempo of the supply flights of VR-2, the training activities of FAW-8, and the transient needs of carrier air groups taxed the landing facilities on NAS Alameda. As a result, a series of Outlying and Auxiliary fields were developed for NAS Alameda. These additional fields were under command of Commander Naval Air Bases, 12th Naval District with the squadrons under the command of Commander Fleet Air Alameda both headquartered on NAS Alameda.[81] The first three of these fields were constructed in 1942 at Crows Landing, Santa Rosa, and South San Francisco. In 1943 an even larger auxiliary field was begun at Fallon, Nevada.[82]

A ground school was established on NAS Alameda to support FAW-8's training activities. The ground school, centered in Building 101 (destroyed by fire in 2003), provided a variety of training. Link aviator trainers and celestial navigation courses provided the most specialized training requiring specific equipment.[83] Link Trainers were box-like flight simulators developed by Edwin A. Link in the early 1930s to facilitate training. The Navy was the first branch of the military to utilize the simulators, which were used extensively during World War II and proved

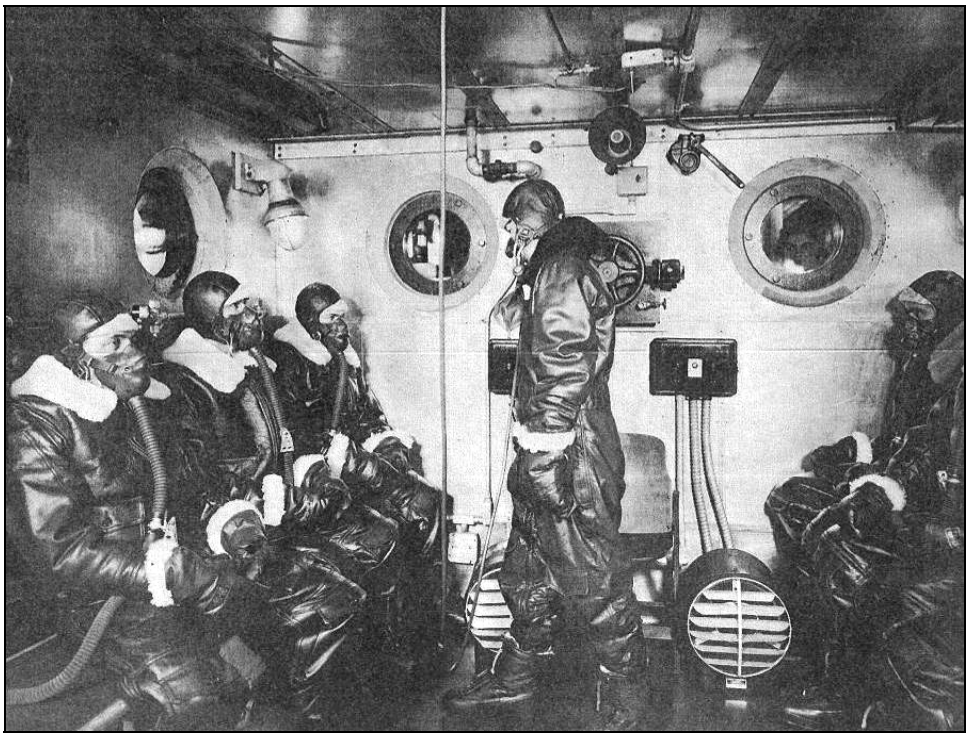
useful in saving lives and saving money while training new pilots.[84] Additional instruction used 'Jam Handy' training films. Henry Jamison Handy developed his films as a way to educate and excite salesmen about new products in the 1930s. During World War II 'Jam Handy' films were common training tools for all types of activities. On NAS Alameda, Women Accepted for Volunteer Emergency Service (WAVES) used the films and interactive training devices to teach gunnery techniques.[85] An atmospheric chamber in Building 130 allowed medical staff to train aviators in high altitude operations (**Photograph 23**). Other ground school training included bombing, navigation, radar, and aircraft gun turret maintenance.[86]



Photograph 23: Atmospheric chamber on NAS Alameda used for aviator training, dated 1945.[87]

The increasing demand for personnel in all departments created a need for training across all departments. The personnel branch of the A&R Department undertook civilian training in aircraft maintenance and assembly in Building 132 (since demolished) in the northwest corner of the station near Hangar 20. The vocational training program included all trades necessary for the

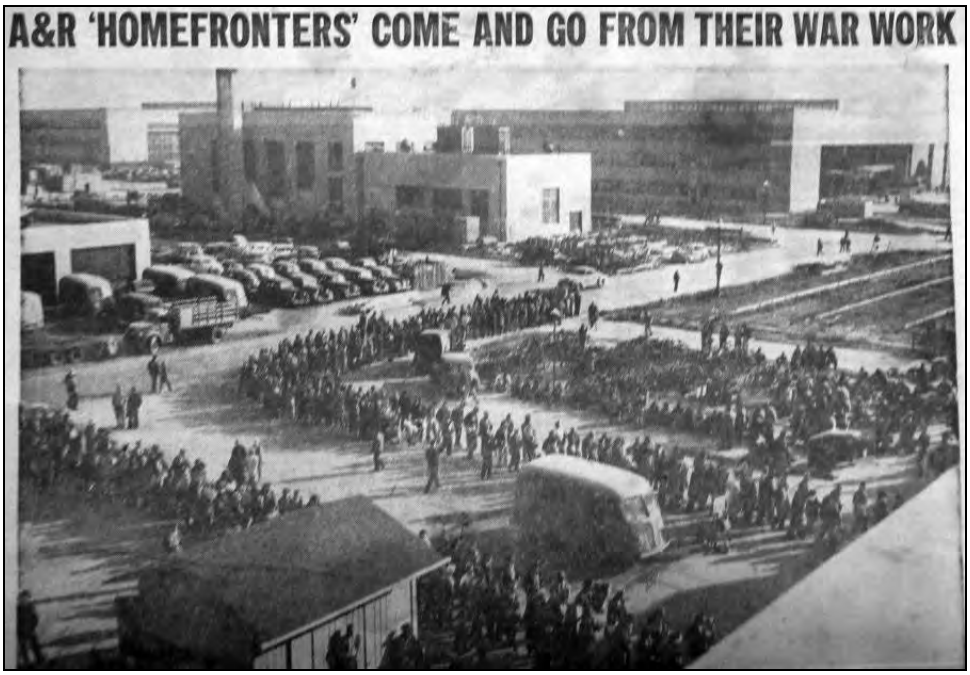
repair of aircraft handled by A&R. Other classes prepared personnel for work in Vocational training added classes in parts identification and accounting for the Supply Department.[88]

The war dramatically changed the character of not only NAS Alameda's built environment, but also its workforce. During the war the station's workforce expanded to 18,000 military personnel and 9,000 civilian workers (**Photograph 24**). Civilians and enlisted men comprised the bulk of the station's pre-war personnel, but as more civilian men were drafted into service and stationed elsewhere, women took on an important portion of the industrial work at Alameda.



Photograph 24: War-time shift change at Building 5 from *The Carrier,* December 15, 1944.

Women also made their way into the Navy as WAVES. Created by Congress in 1942 following the creation of the Women's Army Auxiliary Corps (WAAC), WAVES initially worked in support roles as chauffeurs, nurses, clerks, and cooks and custodians, and later worked in training and technical roles. They were stationed at naval installations throughout the continental United States and, eventually, overseas. The first WAVES arrived at Alameda in 1943, and were given their own barracks: Building 78 (last used for applied instruction) and Buildings 79 through 82 (the latter of which have been demolished).[89] These barracks had just been completed for use by enlisted men, and were converted to use by the WAVES. As at other naval installations, the duties of WAVES at Alameda expanded over the course of the war. At first they were limited to

[88] "Vocational Program is Successful," *The Carrier,* 21 December 1943.
[89] "Wave Lengths," *The Carrier,* 11 August 1944, 7; "Wave Lengths," *The Carrier*, 6 October 1944.

support roles such as secretarial and courier service. By war's end, WAVES were involved in aerial gunnery training, parachute packing, air traffic control, aircraft repair, and other technical fields.[90] Marilyn York, current president of the Alameda Naval Air Museum, arrived on NAS Alameda as a WAVE in 1943. Initially a driver and courier for the Commanding Officer, she arranged transfer to the A&R department where she did aircraft repair. Ms. York went on to a 30 year career as a civilian technician on NAS Alameda, working on fuel control devices in Building 66.[91]

The rapid increase during the war of personnel and activity required additional facilities. In peacetime the Navy had a phased program to build the station, which likely would have taken years to complete. Many of these phases were rapidly speed up and completed during the war years. Pre-war construction tended to be of permanent concrete construction, while most buildings constructed under President Roosevelt's national emergency declaration and wartime contingencies were of temporary, wooden construction.[92] Along with different building designs and materials, the changing war needs resulted in additional construction and modifications to the station's original 1939 plan. As noted above, original plans called for the primary east-west axis to create a wide spatial division between the administrative and industrial functions of the station. Although this axis was first abandoned before the early phase of construction when the landplane hangars were aligned parallel to the airfield, during the war, the space was filled with shops and training facilities. Initial construction in the axial area was small, consisting of two engineering buildings (Buildings 42 and 44) and a small weapons shop (Building 43) at the west end. Construction continued in the area with the civilian cafeteria (Building 62) in 1942, Ground Training Building (Building 101) in 1942, Ordinance Office (Building 102) in 1943, Public Works Shop (Building 114) in 1944, and Storage Racks (Building 191) in 1944.[93] The last portion of this axis to be filled was the northern expansion of Building 5, the Interim Overhaul

Building, in 1945, which was usually referred to as Building 5A. This addition had not been included in the original station plans and nearly doubled the size of Building 5. Construction through the space originally slated as the primary east-west axis further elevated the primacy of the east-west axis stretching from West Essex Street through Building 3.[94] (See **Illustrations 3** and **4**, as well as **Photographs 2, 3, 4,** and **5.**)

Some wartime construction completed the station's 1939 plan, some buildings were placed appropriately within the functional layout of the station's original plan, and many buildings were constructed during the war in areas that had been previously unplanned. The Navy, for example, expanded Building 10 in 1945 into the area between Lexington Street (Second Street) and Saratoga Street (Third Street) in order to accommodate additional generators. This building completed the symmetrical design that had been intended for that location.[95] The expanding Supply Department constructed wooden warehouses (Buildings 91 and 92) were built in alignment with Buildings 8 and 9, filling in space that had been indented for storage facilities. Increasing numbers of personnel during the war made necessary the expansion of the Enlisted Barracks (Buildings 2 and 4) from 14 to 20 wings, completing their original designs. Previously unplanned buildings included temporary buildings, like the corrugated metal Armco Huts and wood frame barracks. The Navy also added multiple facilities east of the Seaplane Lagoon, in a secondary space that was not within the original design's axial and formal layout. In 1942, four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98) along with the shipping warehouse (Building 105, since demolished). The Navy also expanded the station into the former Peralta land grant between the tide lands and Main Street.[96] Dredging added land to the station east of Piers 1 and 2. This allowed for the construction of the two wharfs and Pier 3 in 1945.

The need for station housing – like almost every aspect of activities on the station – increased throughout the war. In 1942 the Navy planned for five new temporary barracks on NAS Alameda.[97] They were located south of the original east-west axis and east of the storehouses. The five temporary barracks (Buildings 78 through 82) were constructed according to the Navy's

B-1 plan for H-type barracks.[98] The Navy had adopted the design for B-1 barracks at the end of World War I, and used it through 1942. Only one of these barracks (Building 78) remains on NAS Alameda.[99] The barracks housed 300 men, with laundry and latrine facilities in a central area. The wood frame buildings, with either horizontal wood siding or cement-asbestos shingles, were supported on concrete piers. Central columns provided support for the sailor's hammocks.[100] These five buildings were altered in 1943 to provide divided cubicles required for WAVES.

These barracks did not solve the housing problem, so the Navy built additional standard barracks south of Midway Avenue (Avenue C). These barracks used the B-1-B standard plan developed after 1942 that utilized fewer construction materials.[101] On NAS Alameda, three rectangular B-1-B barracks were arranged in U shapes. These were constructed in two phases in 1943 and 1944, and filled the remaining northeast corner of the station from Tower Avenue (Avenue F) to Main Street (**Photograph 25**).[102]

Quonset huts were erected south of the east gate under the Homoja Program for temporary housing of sailors' families staying on base for 60 days or less.[103] All of the temporary housing in the east portion of the station bound by West Midway Avenue to the north, Orion Street to the east, West Tower Avenue to the south and Moonlight Terrace to the west, except Building 78, were subsequently demolished over several decades following World War II.

By the end of the war, the station had grown to accommodate 158 buildings with remarkably little interruption to the original 1939 station plan. The operational units remained intact and the Navy had built core portions of the original layout. Station personnel and employees, of course, quickly nicknamed various areas. The massive concrete Bachelor Enlisted Quarters (Buildings 2

and 4) constructed before the war were known as the "Marble Mansion," whereas the temporary wooden barracks became known as "Splinterville."[104]

Photograph 25: Construction of temporary style barrack on east end of NAS Alameda, 1944. Numbers indicated specific projects on original photograph.[105]

Splinterville, first used to orient quickly-inducted Navy personnel to military life, was initially the Receiving Unit, and operated semi-autonomously. Later official records refer to the area as East Barracks (**Photograph 25**).[106] Land at the northern edge of the airfield where damaged aircraft were stored before overhaul was commonly known as "Siberia."[107]

The Navy continued construction to increase the operational capacity of the station throughout the war. Pier 2, the aircraft carrier pier, was constructed of reinforced concrete on cast concrete

pilings in 1941.[108] Pier 3, a second, larger carrier pier, was added in 1945 late in the war to accommodate the Navy's ever larger ships. Navigation in the station's channels was hampered by silting in the pier area and turning basin. In 1945 the Navy hired the Basalt Rock Company of Napa to build another mile-and-a-quarter breakwater south of the piers, to protect them from storm damage and reduce silting in the channel and turning basin.[109] The new breakwater was the result of three years of design and testing by the Army Corps of Engineers.[110]

After transferring trees and plants from the Golden Gate International Exposition in Spring 1941, the Navy began executing the planting plan Johnson, Drake, and Piper subcontracted Emery LaVallee to design. By January 1942, one month after the U.S. entered World War II, many of the trees called for in the plan, and a few additional ones, had been planted on the station, and by the end of the war, portions of the plan had been implemented throughout the station, particularly in the administrative core, residential, recreation, and shops areas (see Cultural Landscape Report for further discussion of the development of the planting plan during World War II).

Throughout the war years, NAS Alameda served a valuable role in naval operations and demonstrated the critical role aviation had within Navy strategy and operations. Swarms of Navy and civilian personnel carried on activities aimed at providing support services to the striking arm of the fleet. Its training facilities prepared service personnel for duties in forward areas, and air crews in flight operations. Its shops and repair facilities assembled aircraft and returned battle-damaged aircraft to the fight. It provided a homeport for combat ships, and a resupply and service location for their crews and equipment. In all of this NAS Alameda was like the many naval facilities around San Francisco Bay, along the Pacific Coast, and along the Atlantic seaboard – it helped keep the Navy fighting.

2.2. Cold War Era (1946-1989) – Station Development, Functions, and Accomplishments

At the end of World War II, the United States and Soviet Union emerged as the world's two major powers. Fueled by a clash of ideologies, a new state of hostile relations between the U.S. and its allies and the Soviet Union, the Peoples' Republic of China, and their client states developed into a "Cold War" of propaganda, economic pressure, and covert actions. From its beginning in 1946 until the fall of the Berlin Wall in 1989, the Cold War era was a period of

Hudson, United States Department of the Army, Corps of Engineers, Mississippi River Commission, *Technical Memorandum No. 2-242, Breakwater Location U.S. Naval Air Station, Alameda, California, Model Investigation* (Vicksburg, Mississippi, Waterways Experiment Station, December 1947), 1-2.

great military expansion to meet the perceived threat from the nation's adversaries. While the United States followed its policy to contain communism, the international community widened its influence in dealing with conflicts around the world through the efforts of the United Nations. In the United States, the race to develop and deploy advanced weapons for defense and deterrence led to the rise of an extensive defense industry, which provided the military with a flow of new technologies and improved equipment. Although the Cold War was marked by expanding nuclear capabilities, conventional weapons and strategies were the major instruments used by the U.S. military to shape the outcome of conflicts throughout the period. Specialized facilities of this period – for example what is now Naval Air Weapons Station China Lake – contributed to the improvement, development, testing, and evaluation of new weapon technologies; however, NAS Alameda, like most stations, continued to support active military and routine missions and operations. Through the early Cold War, NAS Alameda and other air stations adapted to service new technologies and equipment developed elsewhere by adding facilities to accommodate and maintain jet aircraft and other conventional weapons. However, technology outpaced the station's development. The expansion of San Francisco Bay Area urban development, expense of maintaining facilities, and reorganization of Naval shore establishments with changing missions and military requirements led to the eventual decommissioning of the station after the Cold War ended.

2.2.1. Post-World War II (1946-1950)

The conclusion of World War II with the atomic attacks on Japan encouraged a belief that future conflicts would involve strategic nuclear bombing. The Army and Air Force took the view that the Navy, despite its successes in World War II, was obsolete. Struggling for survival, the Navy focused upon efficiency and modernization, as well as fighting the next limited conventional war. During this period the Navy increased carrier capacity to accommodate strategic bombers, updated aircraft technology, and initiated guided missile programs. This placed the Navy in a strong position when the Korean War, a limited conventional war, began in 1950.[111]

NAS Alameda, like many other military installations in the immediate aftermath of World War II, experienced a rapid reduction in force. The Navy's demobilization plan called for the service to shrink to one third its 1945 size. By August 1946, a year following the Japanese surrender, the station's force had been reduced from 18,000 military personnel to 187 officers and less than 1,800 enlisted personnel. Aircraft and aircraft parts were preserved and stored for future use; and seventeen vessels, including two decommissioned aircraft carriers, *Enterprise* (CV-6) and *Hancock* (CV-19), were moored at piers on NAS Alameda as part of the Pacific Reserve Fleet

[111] Nathan Miller, *The US Navy: A History* (Annapolis, Maryland: Naval Institute Press, 1997), 247-250.

(**Photograph 26**).[112] The reduction in staff and material led to a station-wide emphasis on efficiency and the goal of completing more with less. Consolidation of activities and the development of new services helped keep NAS Alameda an active part of the Navy's operations.

Photograph 26: Pacific Reserve Fleet in storage on NAS Alameda in the late 1940s.[113]

2.2.1.1. NAS Alameda Operations (1946-1950)

After World War II the Navy consolidated additional activities on NAS Alameda. Having invested millions of dollars in the facility before and during World War II, the Navy sought to continue using it efficiently in the years that followed. It designated the station as one of the three permanent stations of the 12th Naval District, and made NAS Alameda the headquarters for the district. Its post-war mission continued to include flight squadron operations, the Material Division Training School, and Command Fleet Air Alameda operation of outlying fields. The disestablishment of Fleet Air Wing 8 in July 1946 reduced the need for additional airfields. The number of outlying airfields fluctuated as some were returned to civilian use and others utilized as needed. NAS Alameda's VR-2 squadron, a part of Naval Air Transport Service (NATS), was the only west coast transportation squadron that remained in service. NATS was combined with the Air Force's Transport Service in 1948 to form the Military Air Transport Service (MATS).

[112] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 7; Naval Air Station Alameda, *U.S. Naval Air Station Alameda, California* (Baton Rouge, LA: Army and Navy Publishing Company of Louisiana, 1945), np.
[113] Pacific Reserve Fleet, California - Alameda -pictures, maps, justifications, RG 5, CEC/Seabee Museum, NBVC, Port Hueneme.

VR-2 was not subsumed into the Air Force command, and remained a Naval Fleet Logistics Support Squadron serving routes to Navy facilities, supplying military activities in the Pacific islands using the *Mars* seaplane and additional land-based cargo aircraft.[114]

The overall reduction of force resulted in excess ships placed in reserve. The Pacific Reserve Fleet, as it was known, was also managed from NAS Alameda. NAS Alameda provided berthing for an inactive fleet of three light aircraft carriers (CVL), nine small seaplane tenders (AVP), one aircraft repair ship (ARV), one floating dry dock (YRD), and one barracks craft (APL).[115] In February 1950, Navy Weather Central relocated from the Federal Building in San Francisco to NAS Alameda's Operations Building / Control Tower, Building 19 (**Photograph 27**). The new Fleet Weather Central was responsible for collating and disseminating weather information to Pacific Fleet air, surface, and sub-surface craft.

Fleet Airborne Electronics Training Unit, Pacific also began operations on NAS Alameda following World War II. The unit added new aspects of aviation training to the station. It performed electronic instrument training for aviators on the ground and in the air. This allowed naval aviators to learn the new instrument systems on NAS Alameda without having to make arrangements for a special course elsewhere. The result of these functions was that NAS Alameda became a support station for fleet-wide operations.[116]

During this period from 1946 to 1950, personnel and resources from NAS Alameda contributed to two major operations. Using its existing facilities, NAS Alameda prepared aircraft for Operation Crossroads at the Bikini Atoll, where the effect of nuclear weapons on naval craft was investigated. The machine shops also performed maintenance on the aircraft used in the Berlin Airlift named Operation Vittles. The large transport aircraft required engine overhaul every 1,000 hours of operation, and engines were flown to Alameda for overhaul. While staffing hours may have increased during these operations, no new buildings or structures appear to have been built for these operations, nor any existing facility altered for the station's contributions to the operations. NAS Alameda was one of several US military facilities involved with these

operations. The aircrew replacement center for Operation Vittles, for example, was at Great Falls Air Force Base in Montana.[117]

Photograph 27: May 1945 dated photograph of Building 19 (Control Tower), camera facing east, complete with crash and rescue vehicle garage (to north / left) and wooden wing in the background.[118]

2.2.1.2. NAS Alameda A&R Activities (1946-1950)

Aircraft maintenance, repair, and overhaul remained a major station mission. The immediate task following World War II was maintenance and preservation of aircraft returning from the Pacific theater. Excess aircraft were 'canned' and 'preserved' for storage. Naval personnel constructed and installed special containers (Buildings 338A-H) for preservation of inactive aircraft, and the Navy shipped additional preserved aircraft off site. Alameda A&R continued to develop new processes, tools, and methods for the care of aircraft. The station, for instance, was one of the first NAS to employ pigmented phenolic resin coating on engine parts as a safeguard against corrosion. These "Bakelite like-resins" were applied in Building 395, which has since been demolished. Indium plating and vapor blasting were used to clean and prepare surfaces requiring fine tolerances. Alameda A&R staff also helped write a number of technical manuals

[117] US Navy, "History of U.S. Naval Air Station Alameda, California, Quarterly Installment, 2 September 1945 to 1 July 1946"; "History of U.S. Naval Air Station, Alameda, 1 October 1947 to 30 June 1948," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); C.G. Glines, "Berlin Airlift: Operation Vittles," *Aviation History* (May 1998), http://www.historynet.com/berlin-airlift-operation-vittles.htm (accessed January 11, 2010).

[118] Building 19 (Control Tower) May 1945, California - Alameda -pictures, maps, justifications, RG 5, CEC/Seabee Museum, NBVC, Port Hueneme.

related to aircraft preservation, including "Preparation of Naval Aircraft for Shipment and Storage" (1947).[119]

Along with work necessitated by returning piston-driven aircraft, Alameda began to support the Navy's new jet aircraft as well. In early 1946, the Navy gave the A&R Department responsibility for overhauling the I-16 Gas Turbo engine (later re-designated the J-31), the first American production jet engine. NAS Alameda was able to meet all the needs of jet engine overhaul by mid-1947 through the alteration and addition of overhaul facilities and extensive training programs. Test Cells 3 and 4 of Building 14 were altered in 1947 to allow testing jet engines (**Photograph 28**).

Photograph **28:** Building 14, Engine Test Facility, photo dated 1945.[120] The engine test cells were built in stages during World War II and altered starting in 1947 to accommodate jet engines.

As jet engine overhaul expanded beyond the capacity of Building 5, engine overhaul activities were installed in Building 66, and additional temporary facilities were incorporated into Building 113. The engine conveyor systems installed in Building 162 for overhaul of jet and radial-piston engines was the first of its kind in the United States (**Photograph 29**). The shift of activities to these buildings east of the lagoon solidified a shift in circulation on the base. Although the formal main gate of the station was at the north entry adjacent Building 30 and Building 31, by this time most military personnel and civilian employees used the East Gate (since demolished)

[119] US Navy, "History of U.S. Naval Air Station, Alameda, 1 October 1947 to 30 June 1948," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 8.

for entry, near these engine overhaul buildings, for much of the base's remaining period of operation.[121]

Photograph **29**: Building 162, Engine Overhaul Building, was constructed as shown in 1945. Following World War II the interior was reconfigured for assembly line overhaul of both jet and reciprocating piston engines.[122]

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as Overhaul & Repair (O&R) and assigned it additional types of engines and aircraft to maintain. In November 1949, BuAer transferred responsibility for the R-3350 engine overhaul program from NAS San Diego (North Island) to NAS Alameda. The piston-driven R-3350 engine powered the Lockheed P-2 *Neptune* patrol and Anti-Submarine Warfare (ASW) bomber, Douglas AD-1 *Skyraider* attack bomber, North American AJ-1 *Savage* carrier-based bomber, and Curtis-Martin JRM *Mars* seaplane. The transfer of the program increased NAS Alameda's usefulness to Navy aviation.[123]

2.2.1.3. NAS Alameda Supply Activities (1946-1950)

The return of surplus aircraft and addition of new aircraft to the O&R Department placed a strain upon the Supply Department. The Supply Department began this period with just over 22 buildings. The volume of returning material required the use of temporary canvas hangars and five gasoline tanks for storage. Additional space was located off station at former Army warehouses. Identification and distribution of excess returned material continued until 1949, when the bulk of it was processed. Even so, space remained limited. In addition to processing surplus material, the Supply Department also began the process of mechanizing some records.[124]

2.2.1.4. NAS Alameda Development (1946-1950)

Despite the continued and increasing work load, NAS Alameda completed little permanent construction during the immediate post-war period. The Navy completed two hangar-like facilities (Buildings 166 and 167) at the southern end of the base in 1947 for aircraft preservation activities. The addition of JRM *Mars* aircraft, among the largest seaplanes operated by the Navy, resulted in changes to the Seaplane Lagoon. The *Mars* required more dock facilities and the seaplane ramps were altered to service the aircraft. The Navy also struggled to meet a growing need for housing. The post-war demographic shift meant that more military personnel were married with families. Following World War II, technically-trained staff reported lack of adequate housing as a major reason for leaving service. In 1947 NAS Alameda converted the temporary World War II barracks formerly referred to as East Barracks into married enlisted housing dubbed "Carrier Courts." The work consisted of dividing the barracks into apartments and adding separate entrances for the units.[125]

Elements of the landscape that had taken shape during initial construction and wartime – station layout, circulation patterns, land use areas, sightlines and view sheds, and implementation of the planting plan – remained intact during this period of NAS Alameda's development. The planting plan, the most transient of landscape elements, matured during this period, and elements of the

original planting design were modified (see Cultural Landscape Report for further discussion of landscape elements during this period).

2.2.2. Korean War (1950-1953)

In June 1950 communist North Korean forces crossed the 38th parallel and invaded South Korea. The United States, in conjunction with United Nations forces, came to the defense of South Korea. Unlike the nuclear war for which the Air Force and Army had prepared, this was a limited conventional war. Because of small targets and fewer bases in the combat theater for bombers, most aerial combat operations fell to the Navy and its aircraft carriers. Successful operations in Korea resulted in additional funding for the Navy, construction of the larger *Forrestal* class aircraft carriers, and accelerated conversion to jet aircraft.[126]

The outbreak of the Korean War in 1950 prompted the Navy to expand operations on NAS Alameda. With President Harry Truman's authorization of U.S. air and sea forces to assist South Korea, NAS Alameda-based Carrier Division 3 launched the first air strikes against North Korean troops. The station itself returned to a wartime footing with well-understood organization, both administrative and spatial (**Illustration 6**). NAS Alameda inaugurated a 48-hour workweek and the O&R Department instituted 10-hour shifts. The Navy brought back into service nearly 270 mothballed aircraft, re-commissioned previously decommissioned ships, and called in reservists. A thousand additional civilians were hired to meet expected wartime demands for aircraft repair and support. By the fall of 1951, NAS Alameda was the largest Naval Air Station in the county with 15,000 military and civilian personnel in eight departments.[127] As during World War II, NAS Alameda teemed with activity as an industrial facility, airfield, and small city. There was constant activity on base, punctuated by civilian employee commuting rush hours that were handled in three shifts to accommodate the great number of personnel coming aboard and leaving the base (**Photograph 30**).[128]

2.2.2.1. NAS Alameda Operations (1950-1953)

Operations on NAS Alameda served a diverse group of ships and aircraft. With the re-commissioning of reserve fleet ships to serve in the Korean theater, the Alameda Group of the Pacific Reserve Fleet was disestablished in June 1951. The expanding number and types of Navy aircraft were reflected by the operations on NAS Alameda. The Bureau of Aeronautics' 1952 expansion located four carrier wings (CVG – 9, 15, 2, 19), two landplane patrol squadrons (VP(l)), two seaplane patrol squadrons (VP(s)), and a Fleet Logistics Air Squadron (VR-2) on NAS Alameda. By early fall 1952, Fleet Air Wing 6 relocated to Alameda. The Fleet Air Wing included patrol aircraft in a land-based wing, and included both patrol and bombers. The establishment of Fleet Logistic Air Wing to serve the Navy's needs beginning July 27, 1950 required additional space. The station updated Hangar 41 for the Wing's administrative use before it moved to Building 155. Transportation Squadron 2 (VR-2), part of the wing, and long-term NAS Alameda tenant, moved from Hangar 40 to 41. The wing transported large amounts of cargo and personnel across the Pacific.[131]

[130] NAS Alameda Yearbook, 1954, Naval Air Station Alameda Photograph Albums, Oakland Library History Room.

[131] Chief of Naval Operations, Aviation Plan 3-52 Planned Expansion of the Naval Aeronautical Organization, OPNAV Instruction 05010.5, 26 January 1952, Naval History and Heritage Command; US Navy, "History of U.S. Naval Air Station, Alameda, 1 July 1950 to 31 December 1950," and "History of U.S. Naval Air Station Alameda, 1

The station struggled to meet the demands of the newly assigned aircraft. The increased size of aircraft following World War II, and the introduction of jet aircraft, made the original runways obsolete. Requests to lengthen the runways were first made in 1945 and appeals continued until 1951 when Congress appropriated funds for a Navy runway expansion program. The runway improvements were part of a $270 million project to update runways at 32 Naval Air Stations and Marine Corps Air Stations. The Bureau of Yards and Docks allocated $2,886,000 to NAS Alameda to update its runway system. This project strengthened and lengthened the northern most east-west runway, creating the new Runway 7-25. Construction of Runway 13-31, a new southeast-northwest runway, required additional fill between the Seaplane Lagoon and western edge of the runway. About the same time, the Navy's construction contractors also filled the bay at the southwestern corner of the station near the piers. The new runways rendered the former southeast-northwest and north-south runways obsolete (**Illustration 7**) and (**Photograph 31**).[132]

Along with constructing two new runways, control tower (Building 19) instrumentation was improved, allowing for instrumented landings. The new runways did pose one problem, because the east end of Runway 7-25 was not visible from the control tower (Building 19). The solution was construction of a secondary control tower on the roof of Hangar 20, providing a partial view of the east end of the runway. Smaller improvements were made to the aviation fueling area and infrastructure including a second small ordinance area along Runway 7-25 (Buildings 353 and 354).[133]

2.2.2.2. NAS Alameda O&R Department (1950-1953)

As during World War II, the bulk of NAS Alameda's activity during the Korean War centered on preparing, maintaining, and modifying combat aircraft. Shipping aircraft to overseas operations like Korea required protective treatments, a special type of preservation. The O&R prepared both Navy and Air Force craft for overseas shipment. Returning aircraft from the Korean theater often required extensive repairs as a result of combat and crash damage. The exigencies of the conflict also prompted retrofitting of new electronic and photographic equipment and new weaponry in the re-commissioned aircraft. In the first half of 1951 alone, the O&R Department modified 130 aircraft, the majority for direct combat operations.[135]

The same advances that made the runway expansion necessary also resulted in changes to the O&R department. Following World War II, NAS Alameda had been designated a repair and overhaul facility for several new engines, including reciprocating engines used on large transports and jets. However, few facilities for these uses had been constructed. In 1947 the Navy began to request appropriations for jet engine test cells on NAS Alameda.[136] These requests were not funded until the expansion of naval aviation facilities in 1951. Along with the runway updates, NAS Alameda also received funding for a new engine overhaul and repair shop (Building 360), and neighboring turbo prop test cells (Building 372). In June 1953, the Navy completed the new four-acre $3.2 million concrete engine overhaul plant (Building 360), that had been designed by station staff.[137]

The station awaited new jet engine test cells; even so, by the close of the Korean War, in 1953, Alameda was the premier jet engine overhaul plant on the West Coast. It serviced the R-3350 and R-4360 reciprocating engines as well as the J-33 (the successor to the I-60), J-35, J-47, J-48, and J-57 jet engines – the principal military jet engines of the 1950s.[138]

The various O&R shops and engine overhaul operations on NAS Alameda continued their transition to assembly line operations. In preparation for completion of the new Engine Overhaul Building (Building 360), NAS Alameda installed conveyor systems and rearranged several of the shops. Two factors triggered the transition from job shop operations, where a single station conducted overhauls, to assembly line operations. First, trained and experienced

[138] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 9.

staff members were leaving, and there were insufficient numbers of instructors and training time available to replace them. Second, the assembly line required less space. The addition of new engine and aircraft types required workspace for each type. Most construction during this period was in Korea, and despite the construction program on NAS Alameda additional space for new aircraft and engine types was not high priority.[139]

2.2.2.3. Supply Department (1950-1953)

The supply department struggled with managing the large amounts of supplies needed on hand for the O&R department, items returning from overseas, and the tons of material transported through the Fleet Logistics Wing. The department attempted several temporary measures to protect the supplies. In 1951 the Navy took possession of 76 acres from the University of California land east of Main Street, and erected four new warehouses in 1953 east of Main Street as a part of the appropriations that included the runway improvements and new Engine and Overhaul Building (Building 360).[140]

2.2.3. From Korea to Vietnam (1953-1965)

Following the end of the Korean War, the United States and Soviet communist forces met largely in proxy wars using conventional weapons. The Navy continued to be an important tool in these conflicts because it was able to project force around the world, illustrating support for U.S. allies. This period, however, was exemplified by deployment of many new, technologically-advanced weapons developed in the previous years. The launch of Sputnik in 1957 accelerated the arms race. No longer were aircraft required for the delivery of nuclear warheads. The Air Force, Army and Navy all developed their own Intercontinental Ballistic Missiles (ICBMs). The Navy's Polaris ICBM could be launched from a submarine. The Navy constructed new nuclear powered ships armed with guided missiles. Throughout this period the Navy, like the other service branches, focused on developing and deploying these and other new military technologies.[141]

The nation's changed position in the world meant that demobilization following the Korean War was more limited than that following World War II. Expansion that began during the Korean

[139] US Navy, "History of U.S. Naval Air Station Alameda 1 January 1952 to 30 June 1952," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); JRP, "History and Historic Resources of the Military in California, 1769 to 1989," 8-5.

[140] The warehouse buildings east of Main Street were a component of Fleet Industrial Supply Center Alameda and not a part of the Naval Air Station.

[141] Nathan Miller, *The US Navy*, 255-260; JRP, "History and Historic Resources of the Military in California, 1769 to 1989," 8-6 – 8-10.

War continued in the following decade, and reflected this new position and the introduction of new technologies to the military. NAS Alameda received additional facilities to support jet aircraft and updated facilities for nuclear powered ships. Between 1947 and 1952, the percentage of jet-powered Navy aircraft increased from less than one percent to almost 20 percent. By the late 1950s, more than half of the engines that propelled Navy aircraft were either turboprop or turbojet. The Navy operated nearly 10,000 aircraft, making it the third largest air force in the world behind the U.S. Air Force and the military of the Soviet Union. By the early 1960s, NAS Alameda was no longer servicing propeller aircraft. More sophisticated jet aircraft had more demanding maintenance requirements, and NAS Alameda was among the Navy's facilities best suited to do so.[142] The Navy's growing reliance upon new technology also required a highly trained support staff. Retention of military personnel with such expertise required upgraded housing, morale, and recreational facilities.

2.2.3.1. NAS Alameda Operations (1953-1965)

In addition to being the headquarters of the Commander, Fleet Air (ComFAir) Alameda, NAS Alameda in 1961 was home port to four aircraft carriers (**Photograph 32**) – the *Essex*-class *Hancock* (CV-19), the *Midway*-class *Midway* (CV-41) and *Coral Sea* (CV-43), and the new *Forrestal*-class *Ranger* (CV-61) – and one support ship; two carrier air groups (CVG-2 and CVG-9) and their ten associated squadrons; two patrol squadrons; and the Pacific Fleet Air Intelligence Training Center (Building 116). Nearly 8,000 Navy and civilian personnel were permanently attached to the station. That same year, with closure of NAS Oakland and transfer to its reserve unit to Alameda, NAS Alameda became the largest Naval Air Reserve Training Unit (NARTU) in the nation. By 1966, 2,700 reservists trained at the station every month. The extensive reserve training program may have, in part, contributed to the decision to relocate NAS Alameda's carrier-based air squadrons to NAS Lemoore (established in July 1961) and NAS Miramar. These transfers were later offset by the arrival of the aircraft carrier *Enterprise* (CVN-65), the world's largest and first nuclear powered carrier, in 1966.[143]

The increase in jet aircraft had resulted in expansion of runways beginning in 1951 and continuing through 1955. The southern portion of Runway 13-31 was filled and a larger runway and taxiways completed. The expansion had unintended consequences. Existing buildings blocked the control tower's view of the east end of Runway 7-25. The options were to raise the control tower 100 feet, or find other techniques for controlling aircraft in that area. In February

[142] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 12 and 15.
[143] US Navy, "Aviation Historical Summary (OPNav form 5750-2) 1 October 1960 – 31 March 1961," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 14.

1956, NAS Alameda became the first airfield to employ closed-circuit TV cameras to monitor and provide "positive control of aircraft traffic." The system, comprised of three 16mm cameras, transmitted real-time pictures of the station's runways to the station's control tower. One camera, located on Hangar 20, covered the northeast corner that was hidden from view. The two other cameras provided coverage of the northwest and southern portions of the airfield with better images than previously available.[144]

Photograph 32: Aircraft carriers on NAS Alameda in 1964.[145]

The Navy's increased reliance on jet aircraft led to the decline of the use of seaplanes. Transportation Squadron 2 (VR-2) had been stationed on NAS Alameda since 1942. VR-2 upgraded to the Martin *Mars* seaplane in 1944, and made regular trips from NAS Alameda to Hawaii. In 1956 the *Mars* seaplanes on NAS Alameda were replaced with new R3Y *Tradewinds*. In August, the *Mars* aircraft *Marianas* made the last *Mars* operational flight from the station. Collectively, the four *Mars* seaplanes – *Hawaii*, *Philippines*, *Marianas*, and *Caroline* – held several flight records for distance and cargo. The R3Y *Tradewinds* used newer turboprop engines and replaced the earlier piston driven propeller *Mars* seaplane. With the retirement of the *Mars* the Fleet Logistic Air Wing Headquarters left NAS Alameda in 1957. The turboprop

[144] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 13; US Navy, "History of U.S. Naval Air Station Alameda, 1 November 1940 to 31 December 1958," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); "TV Used to Control NAS Aircraft Traffic," *The Carrier*, 2 March 1956, 2; "Navy Using Television to Land Planes," *Oakland Tribune*, 26 February 1956, Naval Air Station 1951-1958, Naval Air Station Alameda General Clippings File, Alameda Free Library, Alameda, California.
[145] *The Alameda County Weekender*, 28 November 1964.

engine in the *Tradewinds* proved unreliable and VR-2 was disestablished in 1958. Patrol Squadron 47 (VP-47) was relocated to NAS Whidbey Island in August 1960, leaving NAS Alameda without a permanent sea plane squadron. The station continued to maintain the seadrome landing area through 1966, and completed periodic seaplane operations.[146]

NAS Alameda operated an ordnance division from its early days to arm the carrier and patrol squadrons assigned to the station. Air patrol craft were often armed with torpedoes, so NAS Alameda supported a torpedo shop as a part of the division. Torpedo technology advanced into self-guiding weapons, which the Navy referred to as Advanced Underseas Weapons (AUW). The Ordnance Division assumed the AUW shop 1955, and passed the activity to Fleet Aircraft Service Squadron (FASRON) 116 in 1958 before being transferred back. The Ordnance division began handling more live explosives and shipped materiel through the Naval QuickTrans program, which was airlifted across the country. The increasing reliance on missiles resulted in the growth of the Ordnance Division into a full department responsible for moving guided missiles and underseas weapons transported through the station. The department was later renamed the Weapons Department, which constructed facilities at the northwest end of the airfield, northeast of the intersection of the runways 13-31 and 7-25. These buildings were constructed in two phases: Building 420 in 1958 and Building 497 magazine in 1964.[147]

2.2.3.2. NAS Alameda Overhaul & Repair (1953-1965)

The Cold War focus on technology also resulted in changes to the Overhaul and Repair Department. NAS Alameda received its first jet engines for overhaul at the close of World War II, but improvements on the station to support these new engines were not quickly funded. Resources for jet overhaul and test facilities were requested as early as 1946. Funds for station improvements began in 1951 as a part of a Navy wide facilities improvement. Following the Korean War, improvements continued on NAS Alameda. The increased power of jet engines required new test cell construction, and sophisticated aircraft electronics required additional work space. In 1955, BuDocks authorized over $3.5 million to erect four new buildings: an Electric and Electronics Overhaul building (Avionics, Building 400), a Turbo Jet Test Facility (Building 397) (**Photograph 33**), an Air Turbine Overhaul building (Building 398) and

[146] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 14. By 1968, the Navy had completely replaced its seaplanes with the P-3 *Orion*. US Navy, "Aviation Historical Summary (OPNav form 5750-2) 1 October 1960 – 31 March 1961," and "Aviation Historical Summary (OPNav form 5750-2) 1 October 1965 – 31 March 1966," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco).

[147] US Navy, "History of U.S. Naval Air Station Alameda, 1 November 1940 to 31 December 1958," "Aviation Historical Summary (OpNav Form 5750-2), 1 October 1960 to 30 September 1961," "Aviation Historical Summary (OPNav form 5750-2) 1 April 1962 – 30 September 1962," and "Aviation Historical Summary (OPNav form 5750-2) 1 October 1962 – 30 September 1963," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco).

Compressor building (Building 399). These new facilities were designed by the Henry Kaiser Company.[148]

Photograph 33: Building 397, Turbo Jet Engine Test Facility, 1959.[149]

Completion of Building 360, Engine Repair and Overhaul, freed space in Building 66 which was remodeled to focus solely on engine accessories. By the late 1950s, the O&R Department stretched across 43 buildings on 150 acres – over two million square feet of space.[150]

In 1954 the Navy re-organized its aviation overhaul and repair operations, assigning facilities specific types of aircraft. NAS Miramar was assigned fighters, NAS North Island was assigned antisubmarine and patrol aircraft, and NAS Alameda became the home of light attack aircraft. These aircraft, including the A-1 *Skyraider,* A-3 *Skywarrior,* and A-4 *Skyhawk*, were developed to attack land forces and surface ships. The Air Force also had versions of several of these aircraft, and in 1954 O&R began processing jet engines for the Air Force as well as the Navy. The department continued this service with several contracts at least through 1963. Along with the aircraft the Navy was developing advanced weapons systems for use on these platforms. These weapons began to be serviced through the repair and overhaul operations during this period. The Navy assigned the rework of *Sparrow III* air-to-air guided missiles to NAS Alameda in September 1959. Its successor, the *Sidewinder,* was also assigned to NAS Alameda, and in August 1961 the Navy designated it the West Coast overhaul point for aviation ordnance in place

[148] Program 7, Priority No 138, 21 October 1946; US Navy, Military Public Works Program, Department of the Navy 15 October 1952; Department of the Navy Public Works Construction Program FY 1955, 5 March 1954, California – Alameda – pictures, maps, justifications, RG 5, CEC/Seabee Museum, NBVC, Port Hueneme; U.S. Navy, Bureau of Yards and Docks, *Civil Engineering Corps Bulletin* 2, no. 8 (August 1957): 18.

of NAS North Island. The *Bullpup* air-to-surface missile used by attack aircraft was added to the station's responsibilities in 1962.[151]

In the late 1950s, the Navy once again reorganized the overhaul and repair process. It merged BuAer with the Bureau of Ordnance to create the Bureau of Naval Weapons (BUWEPS). BUWEPS was to oversee aircraft maintenance. BUWEPS did away with the practice of completely overhauling aircraft at the end of service tours, and instituted a three-tier system of progressively more extensive upkeep, repair, and modification – what was termed "Progressive Aircraft Rework" (PAR). PAR was intended to be more cost-effective, with each aircraft receiving the specific level of maintenance it required. Routine repairs, installations, and modifications – so-called "FIRST LEVEL" maintenance – was to be executed by aircraft squadrons themselves. In "SECOND," or "INTERMEDIATE LEVEL" maintenance, station-based Aircraft Maintenance Departments (AMD) were to perform more detailed engine work, overhauling specific components, and undertaking small repairs. "THIRD LEVEL" maintenance, heavy-duty repair and overhaul, was to be performed by O&R Departments on aircraft requiring the most work. NAS Alameda handled all three levels. Fleet Air Service Squadrons (FARSONS) 8 and 116 on NAS Alameda were absorbed into NAS Alameda's AMD, created in 1959.[152] This centralized intermediate repair in Hangar 41.

The O&R Department continued to employ the latest equipment and techniques. In January 1963, it began employing the Sperry Reflectoscope, an early ultrasonic corrosion-detecting device. The department also won accolades from the San Francisco Bay Area chapter from the American Institute of Industrial Engineers (AIIE) for its automated storage system. The system, which employed a hydraulic lift and vertical floor-ceiling storage racks, enabled an operator to store or retrieve pallets of materials with minimal effort. The system reportedly saved $33,000 the first year, and freed nearly 9,000 square feet of storage space. The AIIE named the department its "Organization of the Year" in March 1964, praising O&R for "making the most significant use of industrial engineers to increase its operating efficiency."[153]

[151] US Navy, "History of U.S. Naval Air Station Alameda, 1 November 1940 to 31 December 1958," "Aviation Historical Summary (OpNav Form 5750-2), 1October 1960 to 30 September 1961," "Aviation Historical Summary (OPNav form 5750-2) 1 October 1961 – 31 March 1962," "Aviation Historical Summary (OPNav form 5750-2) 1 October 1962 – 31 March 1963," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); and Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 15.

[153] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 15.

2.2.3.3. NAS Alameda Supply Department (1953-1965)

Expansion of the Supply Department into the station annex during the Korean War allowed the department to undertake a modernization effort thereafter. In 1957 the Supply Department began the process of evaluating "Electronic Data Processing Equipment" for installation in 1961. A Honeywell 800 Electronic Data Processing Machine was selected in 1960 and installed the following year. The computer's memory was quickly upgraded to contain the data necessary for the fiscal and supply management of the station. NAS Alameda completed its conversion to a computerized system in January 1963 and was the first NAS to do so. The completion of the computerization resulted in the creation of a Data Processing Department which eventually moved into Building 62. Naval reorganization affected the Supply Department which became the Regional Aviation Supply Activity.[154]

2.2.3.4. NAS Alameda Housing (1953-1965)

The Navy declared NAS Alameda's housing inadequate in 1958.[155] The federal government was reluctant to become involved in housing development, and designed the Wherry and Capehart programs to meet the need for military family housing through public-private partnerships. Only when flaws in the program became clear did the government directly provide housing through appropriated funds.

Because NAS Alameda was constructed just prior to and during World War II, the base included housing for officers (19 "Big Whites"), 30 units for married enlisted men (CP-1 – CP-30), and plenty of housing for single enlisted men in permanent barracks (Buildings 2 and 4) and temporary barracks (now demolished, previously situated between Midway Avenue and Tower Avenue, and the eastern base boundary and Orion Street).[156] The station was also centrally located in the San Francisco Bay Area, providing its personnel plenty of off-base housing opportunities. Consequently, NAS Alameda did not receive any housing improvements until the 1960s. The first improvements were carried out under the Capehart program. In 1963 NAS Alameda completed the first and only Capehart housing program on station. Under the Capehart

[154] Note that the computerization on NAS Alameda was the first for a Naval Air Station, but not a first Navy wide. US Navy, "History of U.S. Naval Air Station Alameda, 1 November 1940 to 31 December 1958," "Aviation Historical Summary (OPNav form 5750-2) 1 October 1961 – 31 March 1962," "Aviation Historical Summary (OPNav form 5750-2) 1 October 1962 – 31 March 1963," "Aviation Historical Summary (OPNav form 5750-2) 1 October 1960 – 31 March 1961," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco).

[156] Buildings A-U and CP 1-30, *iNFADS*, 2008; USGS, *Oakland West* (Washington, D.C.: USGS, 1959); USGS *Oakland West* (Washington, D.C.: USGS, 1968). The term "Big Whites" is a common nickname for Naval officers' housing, these being usually the largest quarters at a station and were usually painted white.

program, the military planned and managed the housing, while private contractors secured mortgages to construct the housing and were paid back though the rental fees for the units. The Capehart program was discontinued in 1962 as the first developments were under construction on NAS Alameda. BuDocks constructed additional family housing in the following years through direct appropriations. Housing built under either program followed the same guidelines regarding total square footage and architectural styles and cannot be visually differentiated. On NAS Alameda, Capehart and appropriated fund housing replaced existing World War II housing between Midway and Tower roads and east of the older officers' quarters. Additional units were built east of Main Street and north of Webster Street (this area was transferred in 2000 to the City of Alameda and no longer under Navy control). Most of the units in that area have since been demolished. NAS Alameda constructed a total of 200 units under these programs.[157] The Navy instituted family housing to help retain skilled personnel, and was influenced by civilian federal housing programs. It developed its own set of standards that referred to civilian Federal Housing Authority (FHA) guidelines. In 1960 the Navy developed what it called a "family" of standard floor plans. Exterior alterations and variations were acceptable, but deviation from the floor plan required bureau level authorization. However, standardized building materials introduced after World War II were required for all buildings. BuDocks and the Navy preferred single-family units and duplexes, actively avoiding row houses and larger multifamily buildings. NAS Alameda combined multi-unit housing into four and six-plexes, a slightly irregular exemption (**Photograph 34**).[158]

Photograph 34: Typical Capehart multiple family unit, Building 754, camera facing northeast, November 12, 2009.

[158] Kuranda, R., "Housing an Air Force and a Navy," 68, 88-89, 91, and 114.

The new programs promoted overall neighborhood development and encouraged curving streets for traffic control and aesthetics (**Illustration 8**). This altered the orthogonal plan of the east side of NAS Alameda as the housing was reconstructed in the 1960s. Housing density was limited to five units for each acre for semi-detached units at the densest, and four units per acre for single family houses. The Navy deemphasized landscaping in favor of constructing the largest and most comfortable houses for the available funds. Sidewalks were located on a single side of the street, except where officer and enlisted housing adjoined each other. The Navy encouraged the inclusion of family friendly amenities like playgrounds. Site surveys of Capehart neighborhoods have documented the existence of recreational facilities such as children's playgrounds and ball fields. It is unclear if these were constructed with Capehart funds, or other funding sources.[159]

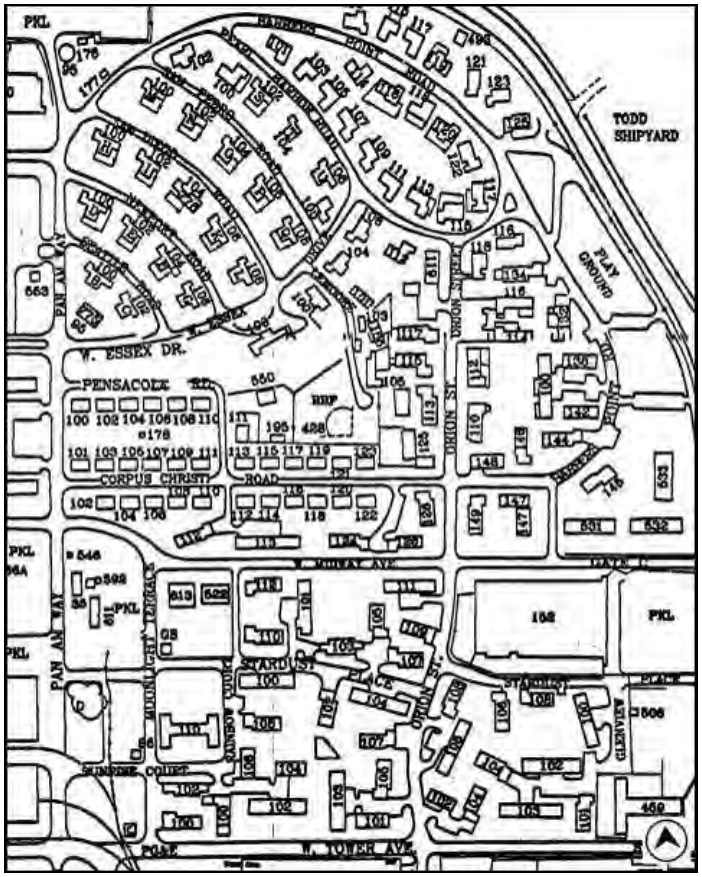

Illustration 8: Map showing housing area in northeastern section of NAS Alameda

The funding appropriations and guidelines set size and dollar limits on the housing units. In 1959 no more than $16,500 could be spent for each unit constructed under the Capehart Act.

[159] Kuranda, "Housing an Air Force and a Navy," 118-119, 129, and 132.

Appropriated funding housing, constructed after the Capehart Act ended in 1962, set both financial limits and square footage limits based on rank. Single family residences were assigned higher-ranking officers, with the maximum number of bedrooms and bathrooms also dictated by rank (**Photograph 35**). Landscape features such as roads, green space and other elements often separated officers and enlisted personnel housing. The Navy was concerned that these limits were inappropriate for flag officers, who, as high ranking officers, usually received the best housing. Construction of flag officer housing was not necessary on NAS Alameda as they were housed in Quarters A, constructed in 1941.[160]

Photograph 35: Single family officers' housing, Building 770, November 4, 2009.

The Navy sought to maximize the size and amenities of each unit, within size and funding restrictions. Amenities included TV antennas, range, refrigerator, exhaust fans, heating and air conditioning, storage, kitchen cabinets, and basic window coverings. Garbage disposals, washers and dryers were included, where possible, and utility hook-ups were a minimum requirement. Dishwashers were provided for high ranking officers (captains and admirals). One parking space was provided for each unit; in warm climates, like California's and NAS Alameda's, carports were preferred to garages. Residential layouts attempted to make the most of the allotted square feet. Hallways were minimized by designing direct access between the main rooms – kitchen, dining room, carport, and service areas. Hallways were found between bed and bathrooms. The use of new techniques and materials also helped the Navy create the

[160] Kuranda, "Housing an Air Force and a Navy," 88, 90,114, and 144; Building A, *iNFADS*, 2008.

best possible housing under the program's limits. The Navy chose materials for economy and durability and used standard components.[161]

Families were moved from the Carrier Courts (current area north of Midway Avenue) and the 600 area (east of Main Street) so that construction of Capehart housing could begin in 1962. The Navy initially built 200 units of Capehart housing, with another 200 planned. The first 200 units consisted of 30 officers' units and 170 enlisted quarters.[162]

NAS Alameda also sought to improve amenities throughout the station. The Exchange moved from Wing 1 Building 2 to renovated facilities in Building 118 (**Photograph 36**). The former warehouse space was divided to create a mall. In addition to the Exchange, offering a variety of clothing and household goods, the building included a cafeteria, watch repair, barber shop, beauty salon, tailor shop, optical shop, photo studio, dry cleaners, laundry and shoe repair.

Photograph 36: Navy Exchange Building 118, camera facing northwest, October 15, 2009.

The development of the complex began in 1962 and was not complete until 1965. A small retail shop was left in Wing 1 of Building 2 to supply daily needs of the enlisted men. Recreation facility expansion included the construction of a six-hole "Pitch and Putt" golf course and a marina in 1960. The Officers' Club and Enlisted Club were redecorated. Other morale and welfare activities included the creation of a nursery and child care in Building 135, sponsored by the Officers' Wives Club.[163]

[163] US Navy, "Aviation Historical Summary (OPNav form 5750-2) 1 October 1962 – 30 September 1963," "Aviation Historical Summary (OPNAV Form 5750-2), 1 April 1965 to 30 September 1965," "Aviation Historical Summary (OPNav form 5750-2) 1 October 1960 – 31 March 1961," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); "New Navy Exchange Facility Opens Doors," *The*

Through this period, the entry mall continued to serve NAS Alameda as a formal space at the center of the administrative core. By the late 1950s, aspects of the mall had been altered, perhaps to provide a suitable space for marching (see Cultural Landscape Report for further discussion of landscape elements during this period).

2.2.4. Vietnam (1965-1973)

Although American military advisors had been involved in Vietnam since the 1950s, direct Naval involvement of NAS Alameda in the conflict did not occur until North Vietnamese torpedo boats reportedly fired upon two American destroyers operating in the Gulf of Tonkin. The incident resulted in passage of the Gulf of Tonkin Resolution by Congress in August 1964. Thereafter President Lyndon Johnson increased the United States role in 'containing' the North Vietnamese Communists. The Navy participated in bombing targets in North Vietnam and operated blockades and patrols in the Mekong Delta. With increased involvement in Vietnam, the Navy faced the challenges and increased demands were placed upon military personnel. Physical and metal hazards as well as casualties increased, and repeated deployments to Vietnam were challenging for personnel and their families. During this time, Secretary of the Navy Admiral Elmo Zumwalt initiated a program focused on paying more attention to morale, welfare and recreation (MWR) needs of personnel. NAS Alameda worked to improve its MWR facilities on station, as well as repair and supply facilities, to support military personnel during increased Vietnam operations. As part of the morale boosting efforts of the station, when incoming carriers from Vietnam came to port on NAS Alameda, there was an effort to honor returning military personnel with large welcoming crowds.[164]

2.2.4.1. NAS Alameda Operations (1965-1973)

Throughout the Vietnam War era, NAS Alameda continued its mission of operational support and aircraft overhaul and repair. The five attack carriers that had NAS Alameda as their home port – *Hancock*, *Midway*, *Ranger*, *Coral Sea*, and *Enterprise* – were all deployed to the Vietnam theater. As in previous conflicts, NAS Alameda was instrumental in aircraft rework. The carriers sailed to Yankee Station in the Gulf of Tonkin, off the coast of Vietnam. From this location, as a part of Task Force 77, they launched reconnaissance and air to ground attacks on targets in North and South Vietnam in Operation Rolling Thunder from March 1965 to

Carrier, 19 May 1965, 1; "Station Nursery May be Answer to Parents Babysitter Problem," *The Carrier*, 10 August 1956, 4.

[164] Nathan Miller, *The US Navy*, 263-270; JRP, "History and Historic Resources of the Military in California, 1769 to 1989,"8-10 – 8-12; Baack, oral history interview, December 8, 2009.

November 1968.[165] During this time the Navy added *USS Oriskany* to the station's complement of carriers, along with the Combat Stores Ship *USS Mars* (AFS-1). The *USS Mars* and *USS Niagara Falls* (AFS-3) were examples of a new class of supply ship replacing three earlier classes and operated a new underway replenishment system. Other support ships included the *USS Repose* hospital ship. Yankee Station was far from usual supply points, so underway replenishment via Combat Stores Ships like the *USS Mars* and *USS Niagara Falls* was necessary to allow the carriers to remain active there. The hospital ships also provided critical medical care for personnel wounded in action in Vietnam. Use of the station's docks for transport of military goods by other branches increased during the war. [166]

The addition of the *USS Enterprise*, the world's first nuclear powered aircraft carrier, to NAS Alameda required additions to its facilities for ship support. It was larger than any other aircraft carrier previously assigned to the station. Dockside utilities were increased and additional morale, welfare and recreational facilities added for the crew. The Navy also began a program dubbed 'Cold Iron' that required changes to the piers. Under Cold Iron when a ship was in port, all ship systems would be shut down and utilities provided from land based connections. This allowed a reduction in the number of crew required to stay aboard. The station began studies of the pier utilities in 1967 to develop plans for their improvement. NAS Alameda installed Mobile Utility Support Equipment (MUSE) on the piers to implement Cold Iron. Environmental concerns regarding the ships docked at the piers brought about further alterations in this area of the station and led to ships' sanitary waste, for example, being sent to East Bay Municipal Utilities District facilities for treatment.[167]

Overall growing environmental awareness resulted in Navy actions to mitigate such issues on NAS Alameda. This began in the same period that Congress passed the National Environmental Policy Act (NEPA) in 1969. New laws and regulations led to development of environmental pollution controls on the station such as the pier sanitation systems noted above. Among the largest civilian concerns from the base was noise. In response the Navy constructed noise

[167] US Navy, "Aviation Historical Summary (OPNAV Form 5750-2), 1 April 1965 to 30 September 1965," "Aviation Historical Summary (OPNAV Form 5750-2), 1 April 1966 – 30 September 1966," "1967 Command History, U.S. Naval Air Station Alameda, California," "Aviation Historical Summary(OPNAV Form 5750-2), 1 October 1965 – 31 March 1966," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992; "1971 Command History, U.S. Naval Air Station Alameda, California," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco).

barriers on the airfield and by making changes to the test cell buildings. Engine testing and run up became subject to increasing noise and air pollution control efforts. Concerns about noise led to flights being rerouted to avoid heavily populated areas, and most landings were handled by Runway 31, furthest from the city. The Navy also responded to concerns over hazardous materials by constructing a treatment plant and other hazardous material facilities in the 1960s and 1970s. Limited actions had been taken during World War II and in the 1940s and 1950s to properly contain contaminated waste, much of which ended up in the Seaplane Lagoon or other areas on the station.[168]

The airfield on NAS Alameda became the central landing platform with the Navy-wide retirement of seaplanes in 1968. No longer did NAS Alameda operate two facilities, a land field and seadrome. The airfield, now the only landing platform, was christened 'Nimitz Field,' in January 1967 in honor of Admiral Chester W. Nimitz, who died the previous year.[169] The work, rescue, reconnaissance and transport tasks, once handled by seaplanes, were now divided between large land-based aircraft and helicopters. During the Vietnam War the helicopter became a standard part of military operations.

The station also developed divers within the Ordnance Department to assist with operation and salvage efforts. Divers assisted with underwater recovery of ordnance, crashed aircraft, and elimination of navigation hazards.[170] The Explosive Ordnance Disposal branch of the Weapons Department separated from the Alameda Weapons Department and became a specialized force of explosive ordnance disposal personnel with diving and aerial abilities in 1967. Additional divers were available through Division of Boats and Docks (Building 15) for the salvage of aircraft.

2.2.4.2. NAS Alameda NARF (1965-1973)

In April 1967, the Navy eliminated NAS Alameda's O&R Department and replaced it with a new command, Naval Air Rework Facility (NARF). This reorganization was the result of a more-sweeping administrative transformation within the Navy. In 1966, "Systems Commands" replaced the "Bureau"-structure that had existed since 1842. BUWEPS correspondingly became Naval Air Systems Command (NAVAIRSYSCOM). Under NAVAIRSYSCOM, O&R

[168] Baack, oral history interview, December 8, 2009; US Navy, "1970 Command History," and "1971 Command History," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco).
[169] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 16.
[170] US Navy, "Aviation Historical Summary (OPNAV Form 5750-2), 1 April 1965 to 30 September 1965," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco).

departments became NARFs; air station functions were placed under the direct supervision of the Chief of Naval Operations.[171]

The reorganization of O&R into NARF did not affect the essential overhaul and repair mission of the activity, and NAS Alameda continued as an aircraft maintenance and support facility. Between 1967 and 1972, for example, NARF reworked more than 1,600 aircraft, serviced more than 9,350 engines, and nearly 25,600 missiles. NARF continued the specialization in overhaul of attack aircraft like the Douglas A-1 (successor to the AD-1) *Skyraider*, A-3 *Skywarrior*, and A-4 *Skyhawk* (**Photograph 37**).

Photograph 37: A-3 aircraft outside Hangar 39, August 1972, image provided by Dick Rutter.

However, NARF did assist with other operational needs. As use of helicopters increased O&R began processing them in Building 166 for shipment along with fixed wing aircraft. NARF also continued to service similar aircraft and engines for the Air Force. Growing deployment of guided missiles also increased NARF's service load. The *Terrier* was added to the missiles reworked at Alameda in 1965, and NARF helped develop lists of needed parts and items for its rework. The station was also selected to overhaul the *Phoenix* and *Shrike* missiles. Missile repair and rework was being handled in Building 400, but the facility was growing out of the space, so the station began planning for a new building (**Photograph 36**). Because the facility had been expanded in the years preceding the Vietnam conflict, and with on-going funding restrictions, NARF put its additional operations in existing facilities. One of the few alterations was installation of clean rooms in the hydraulic and propeller shops. NARF also provided

[171] Miller, *The U.S. Navy*, 101 and 269; Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 18.

services to locations off station through the use of maintenance vans, complete with needed equipment and materials for repair. NARF staff also traveled to crash locations to retrieve aircraft for repair. NARF was recognized for its achievements as the first NAVAIRSYSCOM facility to win the Navy Department Craftsmanship Award in 1970 and a year later year received the Secretary of the Navy Activity Award for Achievement in Safety– the highest safety award in the Navy.[172]

Photograph 38: 1960s oblique aerial showing Building 400 in the foreground, located between Hangars 11 and 12 (National Archives and Records Administration, San Francisco).

Civilian activity of aircraft overhaul and repair on NAS Alameda intensified during the Vietnam era to meet increased demands. Throughout the history of the station, O&R / NARF had been part of a military division, but it largely functioned as a civilian activity. A general division of civilian and military personnel had existed on NAS Alameda from the beginning. Civilians conducted the aircraft maintenance, overhaul and repair activities; whereas the military's focus was on the fleet support activities, including ship / aircraft operations and military personnel requirements. As a result, activities of military personnel and those of the civilian employees on the station were often separate from one another. Although the civilian functions supported military operations, the two populations of the station were generally divided from one another. Military personnel had separate eating and recreation facilities than those that were for civilian

[172] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 16, 19; "O&R's Odd Cocoons are Bound for Viet Nam Duty," *The Carrier*, 24 February 1967; US Navy, "1967 Command History, U.S. Naval Air Station Alameda, California," and "Aviation Historical Summary (OPNAV Form 5750-2), 1 April 1965 to 30 September 1965," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco); and "NARF News: Occupancy by Late 1972," *The Carrier*, 3 April 1972.

employees, the latter of which had a civilian welfare and recreation committee that organized functions and facilities for employees. Interaction between military and civilian personnel occurred, for example, during coordination regarding aircraft repair or in informal settings when civilian employees had lunch at the CPO club or Officers' Club. While there was some friction between the groups, with some military personnel referring to civilian workers as "sandcrabs," there was mutual respect regarding the relative expertise of both civilian and military operations.[173]

2.2.4.3. NAS Alameda Supply Department (1965-1973)

The Supply Department continued to support overseas forces, including those in South East Asia, the repair and rework activities of NARF and station supply. The increasing amount of supply needed for the variety of aircraft and activities required continual improvement. Therefore, the supply department progressed in mechanization and computerization of records and benefited from the new technologies introduced to the department. The Navy installed IBM 1050 machines in three warehouses (Buildings 368, 112 and 8) to transmit records to a central base, in addition to adding conveyors to Building 368 to facilitate material movement. The Data Processing Department, located in the first floor of Building 8, updated to an H-2200 computer in 1967 as part of a continued process to make their methods faster and more efficient. By the end of the conflict the Supply Department held approximately one quarter of all the Navy's Aviation supplies.[174]

2.2.4.4. NAS Alameda Station Development (1965-1973)

NAS Alameda underwent many improvements beginning in the late 1960s that focused on the social conditions of military personnel and their dependents. As noted, Secretary of the Navy Zumwalt initiated a program focused on reducing restrictive regulations and paying more attention to morale, welfare and recreation needs of personnel.[175] This included the addition of new housing, recreation and welfare facilities and the establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The last of the new housing units was accepted in 1966. The first set had been constructed under the Capehart

[173] Baack, oral history interview, December 8, 2009; Dick Rutter, former Navy officer A3 aircraft navigator who served on NAS Alameda (1971-1976), oral history interview with Christopher McMorris and Rand Herbert, JRP Historical Consulting, LLC, December 18, 2009; Parry, oral history interview, December 22, 2009.
[174] US Navy, "Aviation Historical Summary(OPNAV Form 5750-2), 1 April 1966 – 30 September 1966" and "1967 Command History, U.S. Naval Air Station Alameda, California," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, NARA (San Francisco).
[175] Nathan Miller, *The US Navy*, 263-270; JRP, "History and Historic Resources of the Military in California, 1769 to 1989,"8-10 – 8-12.

funding program and additional projects followed with Congressional Appropriated funds. Housing included complete replacement of World War II temporary barracks and replacement of housing units east of Main Street and north of Atlantic Avenue. Additional construction continued in the annex area as funds were available. The station updated the interior and exterior of the original BOQ (Building 17) with projects such as the construction of an instructional center and new barbeque area. Six wings of the BEQ (Buildings 2 and 4) were remodeled in 1968 to provide a more homelike feel for the unattached Chief Petty Officers and semi-private rooms for the enlisted personnel. The additional new and improved officer and enlisted housing meant that the last of the Homoja units, temporary Quonset hut housing, could be removed in 1968.[176]

The Navy implemented other improvements to morale, welfare and recreation facilities. This included the completion of a new picnic area at the west end of the airfield in 1966. The Navy also remodeled Building 18 to include 925 new seats in the theater and established the Family Services Center in the building. The Family Services Center had outgrown its facilities in Building 18 and relocated to the World War II-era Building 137 the following year. Family Services provided orientation for families of servicemen arriving on station, location for Navy Wives' Clubs, and temporary hospitality kits of furnishings and household goods for families awaiting their possessions. Continued efforts to improve morale, welfare and recreational facilities led to renovation of the Family Services and Child Care facilities (Buildings 135 and 137) in 1968 (**Photograph 39**).

Additional station improvements included a remodel of the Commissary (Building 152) that included an enlarged butcher's shop and cosmetic improvements and the addition of a new beverage store (Building 517). The chapel (Building 94) was renovated for the first time in 1968 with new pews and carpets. The Federal Credit Union constructed its own building (Building 527) on the station with its own funds. Contractors with the Brunswick Company constructed a new, 24-lane bowling alley (Building 525) behind Building 18. The Navy drafted plans for a new Fleet Recreation Complex, including indoor locker and snack bar and outdoor playing fields in 1970 with construction following in 1971. Construction on new hotel facilities (Buildings 531-533) for Permanent Change of Station (PCS) traveling personnel began in 1970.[177]

[176] US Navy, "Aviation Historical Summary (OPNAV Form 5750-2), 1 April 1965 to 30 September 1965," Box 1 of 2, Naval Air Station Command History, 27 Volumes 1940 to 1992; "1968 Command History, U.S. Naval Air Station Alameda, California," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco); and "Housing 'Deferred' in Cutback," *The Carrier*, 6 January 1966.

[177] US Navy, "Aviation Historical Summary(OPNAV Form 5750-2), 1 April 1966 – 30 September 1966," and "1967 Command History, U.S. Naval Air Station Alameda, California," Box 1 of 2, NAS Command Histories, 27 Volumes 1940 to 1992; "1968 Command History, U.S. Naval Air Station Alameda, California," and "1970 Command History, U.S. Naval Air Station Alameda, California," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco).

Photograph 39: Building 137 shown below the BOQ landscaped drive, circa 1965.[178]

The establishment of Construction Battalion Unit (CBU, also known as Seabees) 490 on the station in 1970 resulted in a series of self help projects to improve facilities. The Seabees constructed the Exchange parking lot, rehabilitated the Marine Barracks, remodeled Wing 1 Building 2 for the new station Reception Center, added baseball fields, expanded the recreation marina, and rehabilitated Building 137 for a Youth Center. In 1971, the Seabees remodeled The White Hat Club (Wing 20 Building 4) to include more dance floor and social areas. Large projects like the construction of the Fleet Recreation Center (Building 542), rehabilitation of Building 4, were still contracted out.[179]

2.2.5. From the End of Vietnam to Base Closure (1973-1997)

Following the Vietnam Conflict, the U.S. military entered a period of uncertainty as the nation's foreign policy adapted to new conditions. After 1977, President Carter's administration focused on supporting the North Atlantic Treaty Organization rather than exceeding the Soviet military build-up. As a result, Congress cut budgets for new ships and deferred improvements to the Pacific theater forces. The military also became a completely volunteer force, necessitating changes in recruitment, retention, and advancement policies for military personnel. This continued the demand for increased attention for morale, welfare and recreation facilities. The trend for reduced spending and the European focus of the late 1970s was completely reversed in the 1980s by the Regan administration, with increased spending on new and technologically-

[178] 1960s oblique aerials, Box 4, Photo 1, Record Group 181, 3195B-C, National Archives and Records Administration, San Francisco.

[179] US Navy, "1970 Command History, U.S. Naval Air Station Alameda, California," "1969 Command History, U.S. Naval Air Station Alameda, California," and "1971 Command History, U.S. Naval Air Station Alameda," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997; "Up on the EM Club's second floor," *The Carrier*, Between July 21 and August 18, 1975, Box 4:1975-1979, RG 181, NARA (San Francisco).

advanced ships and submarines. The new focus was on technologically superior weaponry, and quick military responses required the use of naval forces to dispel unrest around the world through the end of the Cold War. Congress again cut military spending with the fall of the Berlin Wall and shifts in power in Eastern Europe in 1989, and contracts for ships, submarines and aircraft were cancelled. During this period, Congress initiated a process known as Base Realignment and Closure (BRAC) to reduce the number of military installations to sustainable levels.[180]

In 1989, the Cold War that had defined global politics after World War II came to an end and with it the need for the sprawling military force that had developed in the latter half of the twentieth century. The First Persian Gulf War (1991) notwithstanding, policymakers looked to reduce the overall size of the American armed forces through the BRAC process. In 1990, Secretary of Defense Richard Cheney proposed closing all Navy facilities in the San Francisco Bay Area. Despite his recommendation, and with local support, NAS Alameda avoided the initial rounds of BRAC closures. In March 1993, Cheney's successor as Secretary of Defense, Les Aspin, renewed the call for the closure of NAS Alameda and other San Francisco-area naval facilities, and in September, Congress accepted the BRAC commission's recommendation to close NAS Alameda. Fifty-seven years after its commissioning, NAS Alameda was closed in 1997.[181]

2.2.5.1. NAS Alameda Operations (1973-1997)

NAS Alameda suffered from the obsolescence of ships and reduction of naval aircraft in the 1970s. By the end of the 1970s, military and civilian personnel levels were little more than half of what they had been during the height of the Vietnam conflict. NAS Alameda, once home to as many as six aircraft carriers, only served *USS Coral Sea* (CVA-43) and *USS Enterprise* (CVN-65). In 1975 and 1976 three carriers assigned to NAS Alameda were re-assigned or decommissioned. These were the *USS Oriskany* (CVA-34), *USS Ranger* (CVA-61) and *USS Hancock* (CVA-19). In their place were an increasing number of supply ships and oilers at the base. These included *USS Mars* (AFS-1), *USS Niagara Falls* (AFS-3), *USS San Jose* (AFS-7), *USS Kansas City* (AOR-3), *USS Wabash* (AOR-5), *USS Witchita* (AOR-1), and *USS Tulare* (AKA-112 reserve).[182]

[182] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot," 19 and 20.

The station's aircraft groups also changed in nature. The former patrol groups were replaced with light attack squadrons which could perform reconnaissance (VAQ squadrons) or provide refueling (VAK squadrons) in addition to launching ground attacks. However, the reduction in fleet carriers and carrier groups on NAS Alameda that began in 1961 eventually led to the disestablishment of Fleet Air Alameda Command in 1973. NAS Alameda was no longer a hub for carrier operations. Most of the carrier squadrons were relocated to NAS Lemoore in the San Joaquin Valley, once an auxiliary field for NAS Alameda.[183]

Two helicopter squadrons took the place of the seaplanes. Anti-submarine squadron HS-85 began operations in 1970, and Marine Helicopter Transportation Squadron 769 (HMH-769) joined the transportation efforts of Transport Squadrons (VR) 30 and 55. At one point in 1974 only one regular Navy squadron was operating from NAS Alameda, Transportation Squadron VR-30. The other squadrons were reserve units.[184]

Despite the reduction in military assets, NAS Alameda worked to maintain and improve the function of the piers and airfield. Installation of ship support utilities continued through the 1970s. The turning basin, which continued to fill with silt after the construction of the breakwater, was dredged. The Navy resurfaced taxiways and installed new instrumentation and airfield communication equipment.[185]

A series of Shore Establishment Realignments through the 1970s reduced non-tenant activities on station. While initially administrative in nature, the transfer of activities to tenant status and consolidation of activities with other stations would make it easier to remove activities from NAS Alameda and close the station in subsequent decades. The 1973 Shore Establishment Realignment reduced personnel ceilings affecting non-tenant operations in Air Operations Department, Supply, Public Works, Data Processing and Industrial Relations. In the following years several administrative functions were combined with regional activities. The Medical Department became a branch of the Navy Regional Medical Center Oakland. The Public Works Department became the Public Works Center San Francisco Bay which coordinated services for several naval facilities in the Bay Area. Data processing merged with that of NAS Lemoore and NAS Moffett Field to form the Pacific Fleet Data Processing Service Center. In 1979 the Supply

Department's wholesale functions were consolidated with the Naval Supply Center Oakland across the estuary.[186]

One new tenant was added to the station in the 1970s. The Fleet Maintenance Assistance Group arrived in 1973. This group provided training for technical ratings while at the same time repairing carriers and providing ship maintenance.[187] This group evolved into Ship Intermediate Maintenance Activity (SIMA) that emphasized maintenance work rather than training. As a part of this activity a diving locker was established in an existing building (Building 64) allowing work on hulls and other underwater systems (**Photograph 40**). The crews for the activity were housed in the same building with the commissary (Building 152), and shop services were established in Building 162.

Photograph 40: Buildings 15 and 64 in the early 1990s.[188]

Increased defense spending in the 1980s resulted in continued operations on NAS Alameda. Beginning in 1983 the Navy home ported a series of new nuclear powered ships at the station. The *USS Enterprise* (CVN-65) received an overhaul and was joined by the new Nimitz class *USS Carl Vinson.* Along with the *USS Carl Vinson* (CVN-70), the nuclear powered *USS*

California (CGN-36) and *USS Arkansas* (CGN-41) were ported at the station. The Navy assigned support ships to the station, but the large number of supply ships and oilers assigned during the 1970s were eventually reduced leaving only the *USS Roanoke* (APR-7) and repair ship *USS Samuel Gompers* (AD-37) at the station.

In preparation for the new Nimitz class carrier *USS Carl Vinson* and the newly overhauled *USS Enterprise* additional improvements to the piers were made, including additional dredging and electrical work. NAS Alameda had not been designed for carriers of this size, nor was the expanding air and sea traffic in the bay always conducive to their operation. In 1983 the *USS Enterprise* (CVN-65) ran aground in the San Francisco Bay. In 1989 the carrier was assigned a new station.[189]

Flight operations also declined on NAS Alameda, and concerns over noise and safety largely limited operations to Runway 13-31 during the 1970s. By this time, all but one squadron at the station was a reserve unit. The introduction of Helicopter Mine Squadron (HMS) 15 in 1987 was greeted enthusiastically throughout the station. The result of converting most of the station activities into tenant activities left few strong station ties, and they continued to weaken through the 1980s. In 1982, accounting, distribution and purchasing for the Exchange, which had developed into a multi-base function, was moved to the Field Support Office in Oakland. Activities tied directly to the base were further threatened in 1984 when NAS Alameda began participation in a Commercial Activities Program. The program sought to reduce competition with the private sector through privatizing those activities that were not inherently governmental. Exceptions occurred when governmental agencies could provide the needed service or product at a lower cost.[190] This placed many base operations in competition with the private sector.

2.2.5.2. NAS Alameda NARF / NADEP (1973-1997)

NARF was the largest tenant organization on NAS Alameda by the 1970s and its operation and development largely determined the fate of the station. The nature of aircraft rework at Alameda changed in the 1970s. Many of the aircraft that the facility supported, such as the A-4 *Skyhawk*, were phased out in favor of more advanced versions such as the A-6 *Intruder*. Reciprocating engines like the R-3350 were completely obsolete as new, large jet engines became available.

[189] US Navy, "Naval Air Station Alameda Command History 1981," and "Naval Air Station Alameda Command History 1989," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco).

[190] US Navy, "Naval Air Station Alameda Command History 1982," and "Naval Air Station Alameda Command History 1984," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco); US Office of Management and Budget, Circular No. A-76, Performance of Commercial Activities, http://www.whitehouse.gov/omb/rewrite/circulars/a076/a076.html (accessed December 11, 2009).

NARF Alameda also assumed a greater role in preparing ASW aircraft, such as the Lockheed P-3 *Orion* and S-3 *Viking*, than it had previously. The PAR concept was also supplanted by a new doctrine, Standard Depot Level Maintenance. This system assisted the overall military drawdown by performing only the necessary maintenance to keep aircraft flying rather than periodic overhauls. Computerized systems were becoming more central to the work that NARF did, as tools for overhauling and modifying aircraft and weapons systems and as components of those same aircraft and weapons.[191]

By the early 1980s, NARF Alameda confronted varied assignments with diminished resources. It was responsible for four aircraft maintenance programs, seven engine work programs, and two missile programs, in addition to repair work on over 100,000 individual components. However, despite the military buildup during the Reagan administration, budget cuts and large numbers of retirements shrank the pool of experienced military and civilian personnel. The station was also in competition with private contractors. By the mid-1980s, NARF Alameda was the lowest ranked rework facility in the country, and in 1985 it was among 22 identified by the Department of Defense for possible closure.[192] NARF Alameda managed to stave off closure over the next three years. Meetings with employees prompted an increase in productivity and morale, and the station rose to second place among the six NARFs in productivity and management before the Department of Defense decided against closure. In April 1987, NARF Alameda became Naval Aviation Depot, Alameda (NADEP), a name change intended to indicate more clearly the facility's diverse maintenance and support workload.[193]

NADEP Alameda also initiated a number of new construction projects that improved its competitiveness with private industry. These projects included the completion of a new Material Engineering Laboratory (Building 7), a 15,000 square-foot building, in 1986 (**Photograph 41**). A year later, the Navy authorized four other work buildings: a corrosion control center, an aircraft stripping plant (Building 410), a gun repair and test facility (Building 29), and a corrosion control building (Building 25). These projects exceeded $65 million. By 1989, NADEP encompassed 2.3 million square feet of floor space stretched across 92 buildings – nearly 140 acres of the entire station. [194]

Photograph 41: Building 7 in 1987.[195]

2.2.5.3. NAS Alameda Development, (1973-1989)

Through the 1970s, NAS Alameda continued to improve and rehabilitate morale, welfare and recreation facilities through self help programs. The Seabee unit at the station assisted in developing and completing these projects, resulting in the receipt of the Bronze Hammer Award in 1974, 1975, and 1976, given to those stations with the best self-help programs. [196] The self - help activities rehabilitated buildings on station, improved space functionality and reconfigured spaces for new uses. Larger projects initiated before the end of the Vietnam conflict reached completion. The Fleet Recreation Center along the southern end of the base opened in 1975, the industrial sewer system begun in 1970 was completed, and the pier system for the transfer of ships' sanitary waste also went into operation.

The Navy began construction of a new on-station Chief Petty Officer's Club (Building 585) in 1975, refurbished the theater (Building 18), and constructed a new Automotive Hobby Shop (608) and Crafts Hobby Shop (Building 607).[197] NAS Alameda also made investments in recreational facilities and the BEQ. Throughout this period, the adjacent community continued

[196] US Navy, "1975 Command History, U.S. Naval Air Station Alameda, California," and "Naval Air Station Alameda Command History 1977," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco).
[197] US Navy, "1976 Command History, U.S. Naval Air Station Alameda, California," and "Naval Air Station Alameda Command History 1979," Box 2 of 2, Naval Air Station Command History, 30 Volumes, 1968 to 1997, RG 181, NARA (San Francisco).

to complain about noise. While noise and pollution abatement measures had been taken in 1970, additional studies continued in 1981 that lead to alterations of the test cells.[198]

Station development and growth in the 1980s focused on improving NADEP facilities. Major expansion was impossible because of opposition to any new bay fill and the complete urbanization of the surrounding area. Older buildings constructed prior to and during World War II were continuously adapted for reuse, but continued to retain the station's character. Not even the Loma Prieta earthquake, a 7.1 magnitude earthquake that struck on October 17, 1989, disrupted the station. Portions of the station were damaged including the runways and the central air traffic control tower (a portion of it collapsed), but full repairs were effective within weeks.[199]

During this period the vegetation on station required periodic maintenance when diseased or dead plants required removal, or storm damaged trees needed clearing. Plans were implemented in the late 1970s to both remove trees on the station, and to replant trees and shrubs (see Cultural Landscape Report for further discussion of alterations made to vegetation on the station during this period).

2.2.5.4. NAS Alameda Closure (1989-1997)

The end of the Cold War in 1989 prompted the BRAC process to reduce the size of American armed forces. Although Secretary of Defense Cheney recommended the closure of all San Francisco Bay Area naval facilities in 1990, NADEP Alameda avoided the initial round of closures. As noted, Secretary of Defense Aspin continued the BRAC process a few years later and specifically targeting Alameda and five other Bay Area facilities for closure. In September 1993, Congress accepted Secretary Aspin's recommendation and included NADEP Alameda on the BRAC list. At the time of the station's closure, NADEP Alameda employed 2,861 military personnel and 4,025 civilians. Many NADEP Alameda employees were able to transfer to other stations, including a group of NARF maintenance workers who relocated to Naval Base San Diego.[200] Closing ceremonies for NADEP Alameda took place on April 25, 1997 after 57 years of naval operations.[201]

3. PROPERTY TYPES

"Property type" is a term used in historic preservation planning. It has its origin in the "Secretary of the Interior's Standards: Archaeology and Historic Preservation." A property type is defined as "a grouping of individual properties based on shared physical or associative characteristics. Property types link the ideas incorporated in the theoretical historic context with actual historic properties that illustrate those ideas."[202] This definition recognizes that buildings, structures, or objects may be similar in construction and design and therefore share a physical typology, or the properties may share a historical association that is linked to specific theme of their shared historical context.

A historic context, in turn, analyzes potential significance in terms of time, place, and historic theme. As stated in the Secretary of the Interior's Standards:

> Historic contexts, as theoretical constructs, are linked to actual historic properties through the concept of property type. Property types permit the development of plans for identification, evaluation, and treatment even in the absence of complete knowledge of individual properties.[203]

While the concepts as presented in federal regulations and guidelines are somewhat complicated, a historic context is generally common sense in its application. With respect to NAS Alameda, the time, place, theme, and property types are easily identifiable in most instances. In the previous section, the history of NAS Alameda was discussed in two chronological periods: Pre-World War and World War II, and the Cold War era (1946-1989). These periods are then discussed within the Specific Building and Cold War era evaluations. Both periods of study generally reflect the patterns of development of NAS Alameda in regards to support of the U.S. Pacific Fleet, especially the overhaul and repair of aircraft and missiles. The historic context for evaluating properties on the station, therefore, involves a place (NAS Alameda), an historic theme (fleet support), and two areas of study (Specific Buildings and Cold War era). A property type is simply a category of a building or structure that represents that theme in each of the different studies.

The California military state-wide study of historic resources categorized property types that relate to NAS Alameda in broad categories during the World War II period (1939-1945) such as

---

http://www.globalsecurity.org/military/facility/alameda.htm (accessed December 15, 2009); *The Carrier*, final edition, 23 May 1997.

[202] Department of the Interior, "Archaeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines," *Federal Register*, vol. 44, No. 190 (September 22, 1983; October 1995 release).

[203] Department of the Interior, "…Secretary of the Interior's Standards and Guidelines," under "Standards for Preservation Planning," subsection "Developing Historic Contexts." *Federal Register*, vol. 44, No. 190.

New Permanent Installations, Naval Air Stations, and Military Architecture of World War II. In the Cold War period (1946-1989) categories include Weapons Research and Development, Support for Troops Overseas, and Military Architecture of the Cold War Era.[204] Some buildings on NAS Alameda fall into these categories, and some do not. In general, some of the previous categories are too wide or not specific enough for the property types that existed on station and require further division.

In the initial phases of this study, JRP planned to categorize buildings and structures on NAS Alameda into six categories for the Specific Buildings and Cold War Evaluations. These categories were:

- Administrative
- Support, Storage, and Public Works / Infrastructure
- Ordnance / Magazines Training and Instructional
- Morale, Welfare, and Recreation
- Residential and Subsistence

After conducting fieldwork and research the following nine categories for property types were decided upon to help understand the resources on the base within the context of Navy history and military architecture. The categories, as discussed in this section, are:

- Administrative / Training
- Aircraft / Missile Overhaul and Repair
- Airfield / Seaplane Facilities
- Morale, Welfare, and Recreation
- Ordnance / Magazines
- Public Works / Infrastructure
- Residential and Subsistence
- Storage
- Waterfront Operations

The following discussion includes tables that list the buildings / structures on NAS Alameda in terms of property types for the Specific Buildings Evaluation buildings / structures and the Cold War period (1946-1989). Much of the design and construction history for these resources was obtained from the 2008 NAS Alameda *Internet Naval Facilities Assets Data Store (iNFADS)* provided to JRP by the Navy. Additional real property information was obtained from plans in the Plans and Maps Room in Building 1 on NAS Alameda, the Plans Room at Treasure Island, and structure cards from the NAVFAC Archive in the CEC / Seabee Museum at NBVC, Port

[204] JRP, "Historic Context: Themes, Property Types, and Registration Requirements," iv-v.

Hueneme, California. JRP also conducted research at repositories such as the National Archives and Records Administration Pacific Region (San Francisco), the Oakland Public Library Oakland History Room, and the Alameda Free Library. Building plans and real property records provided information regarding both design and construction, including structural materials and building alterations. Because these sources were consulted for the entire survey population addressed in this report, these records are not specifically cited in this section of the report for each individual building. These records all appear in the reference list in Section 6, and the buildings / structures are described on DPR 523 forms in **Appendix C**.

3.1. Specific Buildings Evaluation (1938-1945)

The "Specific Buildings Evaluation" refers to those buildings and structures constructed before 1946 that had not been previously evaluated, or that had received insufficient evaluation in previous surveys. These facilities were reconsidered by this study for their potential NRHP eligibility, either as individual properties within the context of World War II, or as a potential contributor to the NAS Alameda Historic District. The evaluation of these resources followed National Park Service guidance, specifically *National Register Bulletin 15*, as well as the statewide guidance for military properties, and are located on DPR 523 forms in **Appendix C**.[205]

3.1.1. Administrative / Training

There are no buildings on NAS Alameda during the period of the Specific Buildings Evaluation that fall under this property type.

3.1.2. Aircraft / Missile Overhaul and Repair

Overhaul and repair of aircraft for Pacific operations were primary functions of the station during World War II. Large buildings were required to handle the overhaul and repair of multiple aircraft or engines and associated parts. The concrete maintenance hangars (Buildings 11 and 12) with corner piers, large sliding bay doors, and industrial sash windows are examples of this type. The concrete Engine Test Cell facility (Building 14) with its multiple engine test stand sections; the two-story concrete Engine Accessory Test Shop with industrial metal sash windows (Building 66) (**Photograph 42**); and the large, irregular shaped wood-sheathed Engine Accessory Overhaul Shop (Building 162) are other buildings used for various elements of the overhaul and repair functions. **Table 2** lists the aircraft / missile overhaul and repair buildings / structures in the Specific Buildings Evaluation.

[205] CFR Title 36, Part 60; *National Register Bulletin 15*, passim; JRP, "Historic Context: Themes, Property Types, and Registration Requirements."

3.1.3. Airfield / Seaplane Facilities

The Specific Buildings Evaluation includes a wide variety of infrastructure associated with airfield and seaplane operations (**Table 3**), including the runways and associated infrastructure. The Navy built structures within this property type during World War II and in the Cold War era, between 1940 and 1970. The airfield structures in this property type for the Specific Buildings Evaluation include post-war resources, which illustrates the reworking of the airfield facilities throughout the station's active operations. The only true "buildings" within this property type that are part of the Specific Buildings Evaluation is the large concrete Control Tower (Building 19), which is a standardized military design, and the Radio Transmitter (Building 35) which is a concrete, flat roof building with Moderne elements found on other buildings constructed during

the initial phase of station construction in the early 1940s. The concrete and wood piling Seaplane Ramps 1 through 4 were built between 1940 and 1941. The other facilities of this property type that are in the Specific Buildings Evaluation are various types of runway infrastructure, such as paved apron areas and runway lighting systems including that Approach Lighting (Building 201489) and Wheels Up/Wave Off Landing Aids (Buildings 513 and 514) that were expanded after World War II, with the exception of an Aircraft Beacon (Building 20156). Navigational structures located on the airfield, such as the Compass Rose (Buildings 488 and 489) (**Photograph 43**), and the metal-sheathed Tetrahedron (Building 480) are also included in the airfield infrastructure and were installed during the war. The asphalt over a concrete base runways, taxiways, and parking aprons that were constructed during World War II were altered during the airfield expansion in the 1950s. The original five runways represented a compact system of short, wide concrete runways in which three intersected in the center and another two formed a north and south boundary to the system. Parking aprons of concrete filled the eastern area between the runways. The imposition of Runway 7-11 and Runway 13-31 over this early system left most of the area paved although the new runway system was less compact. The modern runways intersect near the northwest corner of the airfield and have separate looping taxiways serving each end. The modern runways have a concrete base covered with asphalt and concrete taxiways.

3.1.4. Morale, Welfare, and Recreation

Facilities constructed to house morale, welfare, and recreation services for military personnel on station that are part of the Specific Buildings Evaluation (**Table 4**) include the large Enlisted Men's Swimming Pool (Building 76) and Gymnasium (Building 134) (**Photograph 44**). Adjacent to the Gymnasium were squash courts and nearby playing field and tennis courts (Buildings 442, 428, and 423). The large wood-frame warehouse containing the Commissary (Building 152) is also included in this category, as well as the flag pole located directly north of the Administrative Building (Building 1).

Table 4. Specific Buildings Study Property Type - Morale, Welfare and Recreation

3.1.5. Ordnance / Magazines

Of the Specific Buildings Evaluation study population, a variety of designs were utilized to store ordnance on NAS Alameda (**Table 5**). The concrete magazines with gable roofs and raised loading docks known as Buildings 26 and 52 are the only two of this design on the station. Concrete arch-type, earth covered magazines are more common place and of standard military plans (Buildings 50, 51, 56, 57, 58 and Buildings 355, 356, 357, 358, 359) (**Photograph 45**), as well as the small, flat topped concrete lockers located with the seaplane and landplane hangars (Building 307, 308, 313, 314, 315, 316, 319, 321, 322). A metal frame smoke drum house (Building 53) with rectangular plan is also included within this group.

3.1.6. Public Works / Infrastructure

The property type for public works / infrastructure for the Specific Buildings Evaluation (**Table 6**) includes a wide variety of buildings and structures on NAS Alameda. The large rectangular concrete Power Plant (Building 10) is a two-story, flat roof building (**Photograph 46**). A large concrete shop building with clerestory was used for locomotive repair (Building 67).

Building 175 is a small, wood-sheathed transformer house and buildings 176, 177, and 178, are small flat top concrete buildings that house utilities. Building 96 is concrete water tank. Buildings 272 and 273 are iron ARMCO huts. Building 292 is a wood-frame rectangular building with gable roof located near the carrier piers (**Photograph 47**). The oldest building is Building 90, which was a temporary wood-frame building with gable roof first constructed as a garage, and later used for administrative / training.

Table 6. Specific Buildings Evaluation Property Type - Public Works / Infrastructure

Building No.	Facility Name	Built

Photograph 47: Public Works Riggers (Building 292), October 8, 2009.

3.1.7. Residential and Subsistence

Only two residential buildings on station are part of the Specific Buildings Evaluation (**Table 7**). The wood-frame barracks with an H-shaped footprint (Building 78), are standard Navy B-1-B plans, and housed the Women Accepted for Volunteer Emergency Service (WAVES) on NAS Alameda (**Photograph 48**). These barracks differed slightly from standard plans on the interior because they included privacy dividers, which was not common for male barracks. Building 89 is an open-bay gable roof metal garage associated with the BEQs (Buildings 2 and 4), which included the Marine Corps barracks in Building 4.

Table 7. Specific Buildings Evaluation Property Type - Residential and Subsistence

Building No.	Facility Name	Built

089	GARAGE / MARINE BARRACKS	1938

Photograph 48: WAVES Barracks (Building 78), November 4, 2009.

3.1.8. Storage

Storage, being a general use category, involves a variety of different structures on NAS Alameda that include for the Specific Buildings Evaluation (**Table 8**) a range of resources from wood-framed warehouses (Buildings 112, 117 and 118) (**Photograph 49**) to wood-frame shelters (Building 271) and small concrete buildings (Building 196).

Table 8. Specific Buildings Evaluation Property Type – Storage

Photograph 49: Storehouse (Building 117), October 15, 2009.

3.1.9. Water Front Operations

Only two buildings in the Specific Buildings Evaluation on station fall into this property type (**Table 9**). The Boathouse (Building 15) (**Photograph 50**) and the Boiler House / SIMA Locker (Building 64), which was originally constructed as a boiler house for the carrier piers, are both concrete buildings constructed on wooden piers.

Table 9. Specific Buildings Evaluation Property Type – Water Front Operations

015	BOATHOUSE	1940
064	BOILER / SIMA DIVING LOCKER	1941

Photograph 50: Boathouse (Building 16), October 13, 2009.

3.2. Cold War Evaluation (1946-1989)

Most of the buildings and structures of NAS Alameda that had been built by the end of World War II continued to be utilized in station operations and functions during the Cold War era (1946-1989). The following sub-sections make note of the more prominent buildings that continued in service after the war, but focused on the facilities designed and built during the Cold War period.

3.2.1. Administrative / Training

Building 1 was designed and functioned as the primary administrative office on NAS Alameda. The large concrete building employs Moderne architectural details in keeping with the other major buildings of the initial phase of construction on NAS Alameda in the years leading up to World War II (**Photograph 51**). Building 90, originally constructed as wood-frame garage, was later converted for administrative use. The large two-story concrete civilian cafeteria (Building 62) was altered to become a data processing center in the 1980s.

No training buildings built during the World War II period remain on NAS Alameda. Building 101, which was destroyed by a fire in 2003, was the only building on station constructed specifically for training during this time. Building 78, which was built and used during World War II as barracks for WAVES, and was later used for apprentice training. **Table 10** lists the administrative / training buildings of the Cold War study.

Table 10. Cold War Evaluation Property Type – Administrative / Training

Building No.	Facility Name	Built

** Building changed use from Residential and Subsistence;
***Building changed use from Public Works / Infrastructure

Photograph 51: Administration (Building 1), October 6, 2009.

3.2.2. Aircraft / Missile Overhaul and Repair

During the Cold War period, NAS Alameda continued to utilize its World War II buildings for aircraft and missile overhaul and repair; however, to meet the increasing workload and technological advances in jet engine technology, additional buildings of this property type were constructed during the Cold War period (**Table 11**).

The World War II-era hangars still in use included the large concrete and steel maintenance hangars (Buildings 11 and 12), and the wood and asbestos panel preservation hangars (Buildings 166 and 167). The sprawling large concrete and steel Overhaul and Repair Building 5, which is the heart of the O& R department, as well as the reinforced concrete Engine Test Cells (Building 14), large concrete and steel Engine Accessory Test shop (Building 66), engineering facility (Building 42) and concrete weapons shop with clerestory (Building 43) are all World War II construction that continued to be used during the Cold War era. The large two-story, wood-frame and wood-sheathed Engine Accessory Overhaul Shop (Building 162) and Ordnance Office (Building 102) built during World War II are the few buildings within this property type with wood sheathing. Others include Building 77, which was used as a Radio and Radar repair shop and operations building during World War II, became the base's Air Terminal in 1960. The Paint Storage Mixing Room (Building 347) is a flat roof concrete building that was completed just after the war in 1946. The pre-World War II constructed Building 163A is red brick and was built as a chemical warehouse before the Navy took possession of the property in 1938. The Navy used Building 163A shop building during the Cold War era mostly in support of O&R functions.

New construction in and after 1946 included a large concrete, flat roof with sliding bay doors Avionics Building (Building 400) that was erected between Buildings 11 and 12 in 1957 (**Photograph 52**). The Advanced Underwater Weapons (AUW) Shop (Building 420) is also a large, concrete building with multiple roof heights that was completed the following year, along with the Turbo Jet Engine Test Cells (Building 397), which is a flat roof concrete building with a series of three sets of interconnected exhaust towers. The Turbo Prop Test Cell (Building 372), also has two metal exhaust towers in front of a set of large metal roll-up doors on the west end, with the same roll-up doors on the east end. They are similarly configured to the southeast end of Building 14, the World War II-era test cell building.

Large metal-sheathed buildings date to the Cold War era include the gable roof Building 113, double-gable building with multiple bay sliding doors (Building 410) and the Corrosion Control Facility (Building 25) constructed in 1987. Building 500 is a gable roof, corrugated metal building with three open bays and an enclosed office area built in 1964. The Engine Overhaul (Building 360) and Air Turbine Overhaul (Building 398) have similar corrugated metal-sheathed exteriors with a colored band near the roof line and large metal roll-up doors.

Pre-fabricated medium size corrugated metal buildings with gable roofs include Buildings 405, 494, 611. Buildings 351 and 346 are ARMCO huts. Building 393 is a three-bay corrugated metal building with shed roof and Building 610 is a flat roof, corrugated metal building attached to Building 360 that houses a high speed grinder.

The Missile Rework Building (Building 530) is a large flat roof building with a rectangular plan and concrete tilt-up walls of exposed aggregate constructed in 1973.

The last additions to the base within this property type and period was a flat Rinse Facility (Building 259) with short concrete sides and drainage system located on the airfield in 1983, a long, irregular shaped concrete Gun Testing Facility (Building 29) built in 1987, and a two-story concrete Material Engineering Lab (Building 7) built in 1985.

*****Building use changed to Airfield / Seaplane Lagoon Facilities

Photograph 52: Maintenance Hangars and Avionics Building (Building 11, 12, and 400), October 1, 2009.

3.2.3. Airplane / Seaplane Facilities

The airplane / seaplane facilities property type for the Cold War era (**Table 12**) includes a wide variety of buildings and infrastructure. Many buildings associated with the airfield and seaplane operations of the base were built during World War II and continued to serve during the Cold War decades. Typical construction materials include reinforced concrete, metal frame, and metal siding. The largest buildings have some minimal Moderne style details, but these facilities tend to be unadorned and utilitarian in appearance. World War II-era hangars landplane hangars (Buildings 20-23), seaplane hangars (Buildings 39-41) (**Photograph 53**) continued to be used during the Cold War era as well. The large concrete Control Tower (Building 19) is of typical military design for naval air stations. Building 77 is a four-story concrete building with Moderne elements that was first used for Radio and Radar repair shops and changed use to an Air Terminal in 1960. Radio Transmitter Building (Building 35) is also constructed of concrete with Moderne style features such as a repeated horizontal element scored into the sides of the building

and rounded door hood, which can be seen on other buildings on station built in the early 1940s. A small wood frame building with shed roof built in 1945 on the airfield housed a Radio Receiver (Building 133).

Runway lighting systems such as Approach Lighting (Building 201489) and Wheels Up / Wave Off Landing Aids (Buildings 513 and 514) were expanded after World War II, especially after the airfield runways were reworked, with the exception of an Aircraft Beacon (Building 20156). Navigation structures such as the Compass Rose (Buildings 488 and 489), and the metal-sheathed Tetrahedron (Building 480) are World War II airfield infrastructure that continued to be used after the war. The asphalt with sub-concrete base runways, taxiways, and parking aprons were constructed during World War II, and then were substantially altered and expanded in the 1950s. Building 451 is one-story, rectangular in plan, and clad in corrugated metal panels, and was installed as a weather station in the 1950s. A helicopter parking pad was added in 1970 (Building 201711).

The Seaplane facilities on NAS Alameda also continued their functions well into the Cold War, including the concrete and wood piling Ramps 1 through 4 are associated with the Seaplane Lagoon and were built in 1940-41, as was the concrete piling Dock 4. The bulkhead (Building 200648) and jetty (Building 200650) enclosed the south end of the Seaplane Lagoon.

3.2.4. Morale, Welfare, and Recreation

The Navy continued to use its World War II-era constructed MWR buildings, as well as expanding these facilities on the station during the Cold War period (**Table 13**).

World War II-era MWR buildings include the large two-story U-shaped Dispensary (Building 16), which has Moderne style elements seen on other major station buildings, such as Building 1. The Ambulance Garage (Building 115), Medical Laboratory (Building 130), and Rehabilitation Center (Building 116) are all wood sheathed buildings constructed during World War II and are associated with the medical department. The Recreation Building (Building 18) is a large two-story concrete building with a repeated horizontal window elements also found on the wood-framed Chapel (Building 94). The Gymnasium (Building 134), Enlisted Men's Swimming Pool (Building 76), and Officer's Bath House (Building 75A) are all flat roof, concrete structures. The concrete Officer's Recreation Building (Building 60), with rounded bay, has been altered since its 1941 construction. A small metal frame building clad with metal and plastic corrugated panels shelters the Officers Club BBQ (Building 419) that was added near Building 60 in the 1950s.

The large concrete Civilian Cafeteria (Building 62), which somewhat mirrors the design of the Enlisted Men's Mess Hall (Building 3), was altered during the Cold War period to become a data processing center. The large wood-frame warehouse that is Building 118 was converted into the Navy Exchange during this period as well.

The Community Facilities Building (Building 135) and Recreation Storage (Building 137) are wood frame structures originally constructed during World War II as a Bachelor Officers' Quarters and associated mess hall, later converted for MWR use during the Cold War. The large wood-frame Commissary (Building 152) has a loading dock, bays, retail entrance, with offices and storage on the second story. Adjacent to the former BOQs is a one-story masonry warehouse-type structure that housed the Bowling Lanes (Building 525) (**Photograph 54**) and the Chief Petty Officer's Mess (Building 585), with irregular floor plan, slanted roof, and concrete construction.

MWR facilities in the southern area of the station expanded with the construction of playing fields (Buildings 251, 252, 253, 254) in 1975, a roughly T-shaped concrete Recreation Center (Building 542) in 1975, and a one-story masonry and glass Auto Hobby Shop (Building 608) with adjacent metal bays (Building 608 A-C) in 1979. An irregularly shaped corrugated metal-sheathed craft hobby shop (Building 607) was constructed north of Building 92 in 1980.

Buildings constructed to expand the Navy Exchange operations included a T-shaped, metal-sheathed Exchange service station (Building 459) constructed in 1962, a pre-fabricated wood and metal building with double-gable roof for the Exchange Beverage Store (Building 517) in 1968, and a metal-sheathed with rectangular plan Package Store (Building 564) in 1974.

The buildings constructed on station with a contemporary architectural design include Building 527, which are two connected rectangular plan buildings with wide flat-roof concrete eaves and recessed walls clad in horizontal metal siding. The Family Service Center (Building 613) is a concrete and stucco building with a flat top pyramid roof clad in Spanish tiles. The Child Care Center (Building 258), built in 1985, has slant roofs, dormers, and recessed entries. The McDonalds (Building 119) is of typical drive-through restaurant design of the 1980s.

Children's Play Yards (FH 2126-2129) were circular play areas located in the multi-family residential area and are no longer present. The remaining building numbers (Buildings 71, 380, 381, 382, 384, 422, 423, 428, 521, 546 and 201187) represent playing fields, courts, flagpoles, bus shelters, and monuments.

*** Changed use from Residential and Subsistence to MWR

Photograph 54: Bowling Lanes (Building 525), December 11, 2009.

3.2.5. Ordnance / Magazines

Although all serving the purpose of storing ammunition on NAS Alameda, a variety of designs were employed for ordnance / magazines during the Cold War (**Table 14**). Two concrete magazines with gable roofs and raised loading docks (Buildings 26 and 52) are the only buildings of this design on the station. Concrete arch-type, earth covered magazines are common place and of standard military plans (Buildings 50, 51, 56, 57, 58 and Buildings 353, 354, 355,

356, 357, 358, 359), as are the small, flat top concrete lockers located with the seaplane and landplane hangars (Building 307, 308, 313, 314, 315, 316, 319, 321, 322). Building 53 is a metal frame smoke drum house with rectangular plan. Buildings 120, 121, and 122 are ARMCO huts that were used to house torpedoes.

Building 497 is a long, rectangular special weapons magazine with loading bays on one side that was constructed in 1964. In 1976, a square plan concrete building with a defensive parapet and round blast walls around the entrances (Building 594) was constructed (**Photograph 55**). Buildings with similar plans are located on NAS North Island in San Diego (constructed at the same time) where they are listed as Special Weapons Magazines.

3.2.6. Public Works / Infrastructure

Public works buildings and base infrastructure are a loosely related property type and do not have a cohesive architectural style because their designs are based on their utilitarian functions. These facilities were constructed throughout the World War II and Cold War period, and date between 1940 and 1989 (**Table 15**). Some of the oldest buildings are the U-shaped Public Works Transportation Garage (Building 6). Other early concrete buildings are the Power Plant (Building 10), Building 67 with clerestory, and small flat roof maintenance shop (Building 27).

A large U-shaped, wood sheathed building (Building 114) housed Public Works functions in a rectangular, gable roof building with open storage bays and small office area (Building 191).

Concrete security buildings include Buildings 30 and 31 at the main gate and security towers at magazines (Buildings 440, 441, 442 and 498).

A series of sewage pumping stations consisting of pads, pumping equipment, and lifts are located throughout the station (Building 287, 449, 468, 469, 492, 493, 592, and 596). Building 562 is two rectangular concrete buildings with slight gable roofs that house the industrial waste pumping station. Water distribution infrastructure includes concrete water tanks (Building 95, 96A and B and 174A and B) associated with a tall, concrete building with glass blocks that houses a water pumping station (Building 173).

The station expanded its electric distribution system and constructed a series of concrete, flat top buildings with metal bays personnel doors (Buildings 552-559) (**Photograph 56**). Other electrical distribution structures include transformer pads (Building 34 and 505) and fenced in electrical boxes (Buildings 411, 412 and 560CA). Building 529 is a tilt-up concrete aggregate wall building with flat roof

Pre-fabricated buildings with gable roofs to meet infrastructure demands include Building 90, which was a temporary wood-frame building first constructed as a garage, and later used for administrative / training, wood-frame rectangular Building 292, the Pump House (Building 340), the Compressor Building (Building 399), the Air Vacuum Pumping Station (Building 470), Building 544 is a Butler-type building, the Hose Maintenance Building (Building 612), and the Steam Boiler Plant (Building 622) and Building 24A, which has a slight gable roof. Building 164 is a gable roof mobile home type structure and Building 263 is an ARMCO hut. Building 19-1 is a prefabricated corrugated metal gable roof garage building with vehicular bays.

Small buildings with shed roofs the housed sewage pumping plants, utilities, and emergency generators include Buildings 86, 175, 176, 177, 178, 392, 491, 501, and 600.

Buildings 584 and 623 have a similar design of a tall concrete block base with corrugated metal siding above, with flat roof and a rectangular plan. Building 584 is also visible by its three exhaust stacks and pipes protruding from the structure's south side (**Photograph 57**).

The Breakwater is located south of the carrier piers on the harbor and is constructed with stones of various sizes, based on CEC design. Other infrastructure includes the storm sewers and railroad tracks.

3.2.7. Residential and Subsistence

Navy personnel housing has represented a large percentage of NAS Alameda buildings since the station's inception in World War II, although a perpetual need for additional units required the construction of many more residential buildings on the station during the Cold War era (**Table 16**). World War II housing for military personnel included the BEQs (Buildings 2 and 4), which are connected by a Mess Hall (Building 3). These large concrete, two-story buildings consist of a central branch with multiple wings with the repeated horizontal scored lines found on other buildings from the early World War II period. Building 3 is a flat roof, concrete building with a series of columns. The rear of the building is connected to Buildings 193 and 63, both concrete with flat roofs. Building 89 is an open-bay gable roof metal building associated with Buildings 2 and 4.

The wood-frame I-shaped barracks (Building 78), is of standard B-1-B plans, and was used to house WAVES. This building differed slightly from standard plans on the inside with the inclusion of privacy dividers in the dormitories, which was not present for male barracks of that period. Building 17 is a large, two-story concrete BOQ with a central east-west section with U-shaped branches on the east and west ends and one-story section branch on the south.

Quarters A and Officers Housing units B-U and their adjacent garages were built in 1941. These large two-story wood-frame homes are clad in stucco with Moderne elements. The residences are located at the northeast corner of the station. Chief Petty Officer Housing (FH0001-FH0030) was built in 1941 and 1942. These small, one-story small houses have a roughly square plan and are clad in stucco with flat roofs.

To meet the growing demand for housing on the station after World War II, the Navy constructed Capehart building program type single-family and multi-family dwellings 1963 to 1965, including large two-story rectangular plan multiple family residences for enlisted men and their families were constructed apartment style with attached carports (FF 738-742, FH 753-764, FH 779-784, and FH 800-837) (**Photograph 58**). Officer housing in the form of one-story, Ranch style houses clad in stucco with attached carports were constructed from 1963 to 1965 (FH 730-737, FH 743-752, FH 765-776). Two of the original playgrounds from 1969 still remain (FH-2127 and 2129).

An additional housing facility completed during the early 1970s was the Navy Lodge (Buildings 531, 532, and 533). The lodge was intended to provide temporary short-term housing on station, and has the appearance of a simple, flat-roofed two-story hotel sided with plywood and concrete.

3.2.8. Storage

Buildings utilized for storage on NAS Alameda are a variety of designs range from large, World War II-era warehouse structures, to pre-fabricated metal buildings installed during the war and in subsequent decades (**Table 17**). Building 8 is a large three-story general storehouse constructed of concrete with concrete towers, industrial metal sash windows, and loading bays. Building 9 has a similar design to the hangars with its slightly gabled roof, towers at the corners, large sliding bay doors and industrial sash windows. Large wooden warehouses include Buildings 91, 92, 112, 117 and 118, all of general World War II-era design. Buildings 168, 169, and 170 are large gable roof warehouses clad in corrugated metal siding built during the Cold War period.

Building 13 is a rectangular building composed of three buildings made of concrete and wood exterior finishes. Building 98 is a one-story shed roof building clad in horizontal wood siding. Building 137, originally constructed as a wood-frame mess hall, was converted for recreation storage.

Covered storage shelters include the wood frame Building 271, which was constructed in 1945. Other storage facilities include Building 540, a small, concrete building with flat roof and a single door, and Building 196, a larger flat roof building constructed of concrete and masonry with a sliding door.

Pre-fabricated buildings were commonly used during the Cold War to expand storage on NAS Alameda. These include smaller type buildings such as 414, 391, 550, and 595. Buildings 338A-H are 19 feet tall pre-fabricated metal buildings with slightly gabled roofs. Buildings 360A-D are small pre-fabricated metal buildings with a full length roll-up door on one end of each unit. Buildings 265, 614, 615, 616, 618 and 619 are small pre-fabricated metal buildings with roll-up bays with a gable roof (**Photograph 59**). Buildings 194, 272, 273, 337, and 388 are all ARMCO huts. Steel frame open sided hazardous material storage area D-13 was constructed in 1984.

3.2.9. Waterfront Operations

For the most part, NAS Alameda met its waterfront operations responsibilities using existing waterfront resources constructed during World War II, such as the concrete Boathouse (Building 15) and Boiler Plant (Building 64 Boiler / SIMA Locker), the asphalt and wooden piling Carrier Piers 1-3, and Wharf 1 and 2, and metal Crane Tracks used for loading and unloading on Pier 3. The Navy increased its operations at the waterfront with the construction of additional wooden dolphins (Building 431 and 512), a wooden aviation fuel pier was constructed in 1953 at the Oakland Estuary side of the station (Pier 4), navigation range lighting for carrier piers (302E and 302W) (**Photograph 60**) and pre-fabricated metal buildings (Buildings 68, 601, 621) (**Photograph 61**). **Table 18** lists the waterfront operations buildings / structures from the Cold War Evaluation.

Table 18. Cold War Evaluation Property Type – Waterfront Operations

Building No.	Facility Name	Built

4. EVALUATION OF NATIONAL REGISTER ELIGIBILITY

4.1. Evaluation Criteria, Program Comments, and Memorandums of Agreement

4.1.1. NRHP Criteria of Significance

The inventory and evaluation of buildings, structures, objects, and districts on NAS Alameda presented in this report was conducted through application of the significance criteria of the National Register of Historic Places (NRHP) program.

Eligibility for listing in the NRHP rests on the twin factors of significance and integrity. A property must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will overwhelm historical significance a property may possess and render it ineligible. Likewise, a property may retain integrity, but if it lacks significance, it is ineligible for listing.

Historic significance is judged by applying the NRHP criteria.[206] The NRHP guidelines direct that a historic resource's "quality of significance in American history, architecture, archeology, engineering and culture" be determined by meeting at least one of the four main criteria. Properties may be significant at the local, state, or national level under the following NRHP criteria:

Criterion A: association with events or trends significant in the broad patterns of our history;

Criterion B: association with the lives of significant individuals;

Criterion C: a property that embodies the distinctive characteristics of a type, period, or method of construction, represents the work of a master, or that possesses high artistic values;

Criterion D: has yielded, or is likely to yield information important to history or prehistory

In general, Criterion D is used to evaluate prehistoric sites and archaeological resources. Although buildings and structures can occasionally be recognized for the important information they might yield regarding historic construction or technologies, the buildings within the study

[206] The NRHP criteria are in the Code of Federal Regulations, Title 36, Part 60.4.

area for this project are of building types that are generally very well documented in primary and secondary sources, and are not themselves the primary source of this information.[207]

Certain property types are usually excluded from consideration for listing in the NRHP, but can be considered if they meet special requirements in addition to meeting the regular criteria. The following are the seven Criteria Considerations that deal with properties usually excluded from listing in the NRHP: [208]

Consideration A: Religious Properties
Consideration B: Moved Properties
Consideration C: Birthplaces and Graves
Consideration D: Cemeteries
Consideration E: Reconstructed Properties
Consideration F: Commemorative Properties
Consideration G: Properties that have Achieved Significance within the Past Fifty Years

The inventory and evaluation analysis presented in this report included the application of Criteria Consideration G for those resources built in 1960 or after. This provided analysis regarding resources that may have achieved significance within the past fifty years and assessed whether such resources are of exceptional importance. In general the military has recognized that there is sufficient historical perspective to evaluate resources for potential significance within the theme(s) of the Cold War. In order for a resource to be considered as having exceptional importance evidence must be presented from scholarly research. Application of Criteria Consideration G for this study took into account the historic context, themes, and methodology for Cold War period properties as presented in the Statewide Study.

The evaluation process requires application of the significance criteria followed by analysis regarding *historic integrity*. Integrity is the ability of a property to convey its significance. Assessment of integrity includes review of extant physical features of resources that are historically significant and of resources that are not historically significant. The assessment of the latter group illustrates that the physical features of those resources have been considered in the conclusions regarding NRHP eligibility. As noted above, a resource must have both

[207] National Park Service, Department of the Interior. *National Register Federal Program Regulations.* Title 36: Parks, Forests, and Public Property, Part 60 National Register of Historic Places, 60.4 Criteria for evaluation. http://www.nps.gov/nr/regulations.htm (accessed 2009).
[208] United State Department of the Interior, National Park Service, "How to Apply the National Register Criteria for Evaluation," *National Register Bulletin 15*, 25, 41-43; "Guidelines for Evaluating and Nominating Properties that have Achieved Significance within the Last Fifty Years," *National Register Bulletin No. 22* (Washington, D.C.: Government Printing Office, 1979, revised 1990 and 1996).

significance and integrity to be considered eligible. A resource may retain integrity, but if it lacks significance, it is ineligible for listing.

There are seven factors of integrity: location, design, setting, workmanship, materials, feeling, and association, and these seven can be roughly grouped into three types. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship of historic properties relate to their construction methods and architectural / engineering details. Feeling and association are the least objective of the seven aspects and pertain to the overall ability of the property to convey a sense of historical time and place. As noted by the National Park Service guidelines, assessment of integrity can sometimes be a subjective judgment, but it is always be grounded in an understanding of a property's physical features and how they relate to its significance in terms of where, why and when a property is significant. Only those properties that retain most of these aspects of integrity – and also have historic significance – are eligible for listing in the NRHP.[209]

4.1.2. CRHR Criteria of Significance

The analysis in this report also included application of the criteria of the California Register of Historical Resources (CRHR), which is largely based upon the criteria and guidelines of the NRHP program. Like the NRHP, eligibility for listing a resource in the CRHR rests on the twin factors of significance and integrity. A property must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will overwhelm historical significance a property may possess and render it ineligible. Likewise, a property may retain integrity, but if it lacks significance, it is ineligible for listing.

The criteria for listing properties in the CRHR are in Section 15064.5(a)(2)-(3) of the CEQA Guidelines, which provide the criteria from Section 20524.1 of the California Public Resources Code. The CRHR is in the California Code of Regulations Title 14, Chapter 11.5. According to this code, properties eligible for listing in the NRHP are automatically eligible for listing in the CRHR. The CRHR criteria are largely based on the NRHP which are codified in 36 CFR Part 60 and explained in guidelines published by the Keeper of the National Register.[210]

The CRHR criteria closely parallel those of the NRHP. Each resource must be determined to be *significant* at the local, state, or national level under one of four criteria (paraphrased below) in order to be determined eligible:

[209] National Park Service, *National Register Bulletin 15*, 44.
[210] The most widely accepted guidelines are contained in the "Guidelines for Applying the National Register Criteria for Evaluation," *National Register Bulletin 15* (Washington D.C.: US Government Printing, 1991, revised 1995 through 2002).

Criterion 1: Resources associated with important events that have made a significant contribution to the broad patterns of our history.

Criterion 2: Resources associated with the lives of persons important to our past.

Criterion 3: Resources that embody the distinctive characteristics of a type, period, or method of construction, or represents the work of a master.

Criterion 4: Resources that have yielded, or may be likely to yield, information important in prehistory or history.[211]

Criterion 4, like NRHP Criterion D, is used to evaluate prehistoric sites and archaeological resources. Although buildings and structures can occasionally be recognized for the important information they might yield regarding historic construction or technologies, the buildings within the study area for this project are of building types that are generally very well documented in primary and secondary sources, and are not themselves the primary source of this information.

The CRHR definition of integrity and its special considerations for certain properties are slightly different than those for the NRHP. Integrity is defined as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance." The CRHR further states that eligible resources must "retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance," and CRHR lists the same seven aspects of integrity used for evaluating properties under the NRHP criteria. The CRHR's special considerations for certain properties types are limited to: 1) moved buildings, structures, or objects; 2) historical resources achieving significance within the past fifty years; and 3) reconstructed buildings.

4.1.3. Application of Nationwide Section 106 Agreement Documents

Three nationwide Section 106 agreement documents were applied to resources in the study population addressed in this report: the PMOA on World War II Temporary Military Buildings; the Program Comment for World War II and Cold War era (1939-1974) Ammunition Storage Facilities; and Program Comment for Wherry and Capehart Era Family Housing at Air Force and Navy Bases. These documents provide streamlined methods for compliance with Section 106 of the NHPA for these specific property types. In each case, the Navy has or is conducting nationwide study and documentation of the properties. Copies of the documents are included in **Appendix F**. When applied to buildings the PMOA or Program Comment is noted on the associated DPR 523 form located in **Appendix C.** Nationwide Section 106 agreement documents have been applied as listed in **Table 19**.

[211] California Public Resources Code, Sections 4850 through 4858; California Office of Historic Preservation, "Instructions for Nominating Historical Resources to the California Register of Historical Resources," August 1997.

The PMOA on World War II Temporary Buildings recognized that temporary buildings from World War II were not intended for permanent use, yet these buildings represented an important period of history. Consequently, the Department of Defense prepared a narrative study of these buildings, documented representative examples of each building type for the Historic American

Buildings Survey (HABS), and identified examples for continuing preservation allowing the removal of most World War II temporary buildings. This PMOA was applied to Building 78 on NAS Alameda along with analysis of other potential areas of significance. Building 78 is a standardized World War II temporary barracks constructed according to the Navy's B-1 plan. The PMOA addressed possible significance for association with World War II and the building's architecture. JRP applied the PMOA in these areas. The Department of Defense has completed the required study, recordation, and preservation efforts under the PMOA. None of the buildings selected for recordation or preservation are located on NAS Alameda, and the Navy's responsibilities under Section 106 of the NHPA in this regard have been met. JRP also evaluated the building for association with the WAVES, for association with the NAS Alameda Historic District, and for association with the Cold War themes. Research conducted by JRP did not identify any significant associations under these themes.

The Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities applies to facilities constructed as, or that fall within the current Department of Defense category group code "42." Twenty five buildings or structures on NAS Alameda are in this category. The program comment does not apply to ammunition storage facilities identified as part of a historic district. None of the buildings or structures subject to this Program Comment have been identified as a part of the NAS Alameda Historic District; therefore, the Program Comment applies to all 25 ammunition storage facility buildings or structures on station.

The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative examples of this property type are located at three Naval Surface Warfare Centers (Crane, Indiana; Dahlgren, Virginia; and Indian Head, Maryland). NAS Alameda was not identified as a possible location of significant examples. The Navy will develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945," and will document the representative examples of the basic types of aboveground and underground ammunition storage facilities. Upon completion of the thematic study, and selection of three representative installations, the Navy's responsibility for these property types under NHPA Section 106, including those on NAS Alameda, will be met. The buildings of this type on NAS Alameda will not require any further treatment under this Program Comment.

The November 2004 Program Comment for Wherry and Capehart Era Family Housing at Air Force and Navy Bases assumes that this property type is generally eligible for listing in the NRHP. Section II.A. of the comment states:

> The Air Force and the Navy have gathered data on their inventory of Wherry and Capehart properties which will be appended to the Army's context study … to provide a comprehensive understanding of the Department of Defense (DoD) inventory for this property type. As with the Army, the Air Force and the Navy consider their inventory of Wherry and Capehart properties, including any associated structures and landscape features, to be eligible for the National Register of Historic Places for the purposes of Section 106 compliance.

The Program Comment applies to 49 single and multi-family housing units constructed in the final year of the Capehart program (started in 1962 completed in 1963) located on NAS Alameda and within the study area. There are no Wherry Program housing units within the study population. These units were a part of a larger housing area that once extended eastward, beyond the current boundaries of the facility, and contained 200 units in total. The units east of the current NAS Alameda boundary (east of Main Street) have been transferred from Navy ownership and this area was not part of the current study.

In order to comply with this Program Comment for the Capehart properties on NAS Alameda, the current study evaluated whether the buildings of the housing program were eligible as part of a historic district and the current study concluded that they did not meet the significance criteria within this context (see Section 5 and the DPR 523 forms in **Appendix C**). The Navy has completed the required contextual study as directed by the Program Comment: "Housing an Air Force and a Navy: The Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)."[213] The report did not identify the Capehart housing on NAS Alameda as an important example. Also in compliance with the Program Comment, the Navy will utilize or modify the Army-produced *Neighborhood Design Guidelines for Army Wherry and Capehart Housing* in their management and maintenance of these properties. The Navy will also advise developers that these properties may be eligible for historic preservation tax credits as a part of privatization projects. No further treatment for Alameda's property is required because the Navy has completed the nationwide treatment steps. Upon the completion of these tasks, the Navy's responsibility for these properties under NHPA Section 106 will be met.

4.2. Results of Previous Studies

4.2.1. Findings of Previous Studies

This section is taken from a previous study of historic properties on NAS Alameda, unless otherwise noted: Jones & Stokes, "Historic Properties Inspection Report for the Naval Air Station Alameda Historic District Alameda, California, Final," prepared for Naval Facilities

[213] Kuranda, "Housing an Air Force and a Navy."

Engineering Command, Southwest and Base Realignment and Closure Program Management Office West (July 2007).

In 1992, architectural historian Sally Woodbridge completed a "Historic Architectural Resources Inventory for Naval Air Station, Alameda" that inventoried and evaluated the buildings and structures on NAS Alameda constructed before 1946.[214] Woodbridge identified a potential historic district comprised of 85 contributing buildings and structures built between 1939 and 1945 (38 contributors located in the central core, and 47 contributors located in the officer housing area). The NAS Alameda Historic District, she concluded, met eligibility requirements under Criterion A, for its significance as a World War II-era naval air station under the contextual theme of the development of U.S. Navy bases in the San Francisco Bay Area during World War II, and under Criterion C, for its master planning and its status as a example of the Moderne style. The district was determined eligible through consultation and concurrence with the SHPO on September 25, 1992.[215] In 1997, the Navy, through further consultation with the SHPO, corrected the number of contributing buildings to account for a total of 49 residences, revising the number of contributing elements from 85 to 87.[216] A fire in 2003 destroyed one contributing building (Building 101), thereby reducing the number of contributors in the District to 86.

In 1997, Stephen Mikesell of JRP Historical Consulting Services completed a "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[217] This document, prepared as a long-range guide for the management and administration of the historic district, expanded upon the 1992 study, and identified the character-defining elements of the historic district. This 1997 Guide identified four functional areas of the District (Administrative Core, Shops Area Hangars Area, and Residential Area) and also identified the significant vistas, open spaces, streetscapes, and landscapes within the historic district.[218]

[214] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" (1992).
[215] Office of Historic Preservation, "Historic Property Datafile for Alameda County," California Historic Resources Information System, as of December 3, 2004; US Navy, Engineering Field Activity, West, Naval Facilities Engineering Command, "Final Environmental Impact Statement for the Disposal and Reuse of Naval Air Station Alameda and the Fleet and Industrial Supply Center, Alameda Annex and Facility, Alameda, California" (October 1999), 3-63.
[216] Daniel Abeyta, State Office of Historic Preservation, Sacramento, CA, letter to Mr. Louis S. Wall, Cultural Resources Program Coordinator, NAVFAC, November 5, 1997.
[217] Mikesell, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," (1997).
[218] Stephen Mikesell (JRP Historical Consulting Services), "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997. As noted above, the "Hangars Area" has been identified as the "Operations Area" in the "Cultural Landscape Report for NAS Alameda" (2011), also prepared by JRP. This reflects the wider functions of the area in which the hangars are situated and their relationship with adjacent spaces including the Seaplane Lagoon and the Airfield.

Also in 1997, JRP Historical Consulting Services prepared a DPR 523 form that evaluated the Alameda Training Wall (also known as the south jetty of the Oakland Inner Harbor Jetties and Federal Channel Historic District) located on land under the jurisdiction and control of the former NAS Alameda. The 1997 evaluation of the wall structure established that 1,750 feet of the Alameda Training Wall appears eligible for listing in the NRHP under Criteria A and C in the areas of transportation and engineering.

In 2007 and 2008, the Navy contracted with Jones & Stokes Associates to prepare a "Historic Properties Inspection Report," and a NRHP Nomination for NAS Alameda Historic District. The Historic Properties Inspection Report reported on the condition of the previously identified 86 contributing elements of the NAS Alameda Historic District. A summary of the district as identified in the 2008 draft NRHP nomination synthesized data from the previous Woodbridge and Mikesell studies of the NAS Alameda Historic District.

4.2.2. National Register District Boundary and Contributing Elements Prior to Current Study

The previous studies described above each addressed contributing and non-contributing elements of the NAS Alameda Historic District, and each described the boundaries of the district. The slight differences between each are presented below.

The 1992 inventory and evaluation of NAS Alameda described the boundaries of the historic district as follows (**Illustration 9**):

> The triangular and quadrangular open spaces that stretch from the Main Gate on the north side of the base southward to the Main Administration Building, and the east quadrangle formed by Buildings 2, 3, and 4 contribute importantly to a dignified and gracious introduction to the base. The principle streets defining the district are the N/S-running First (Monarch Street), Second (Lexington Avenue), Third (Saratoga Street), Fourth (Todd Street), and Fifth (Pan-Am Way and Ferry Point) Streets and the E/W-running Avenues A (Red Line Avenue), B (Essex Drive), C (Midway Avenue), D (Ranger Avenue), E (Hope Avenue), and F (Tower Avenue). The officer housing balloons at the west ends of Avenues A (Red Line Avenue), B (Essex Drive), and C (Midway Avenue) and has its own curved street pattern. Taxiways #4 and #7 mark the east and south boundaries of the district; the outer northern boundary is Main Street. Although Ramps 1, 2, and 3; Piers 1, 2, and 3; and Wharfs 1 and 2 were constructed during the period of significance (the ramps were used for sea planes), they have since lost integrity and do not contribute to the district. The nondescript ammunition lockers, fuel storage drums, and miscellaneous sheds remaining from the period of significance

> are judged not to contribute to the historic district because of their temporary nature.[219]

The 1997 preservation guide described the key elements of the NAS Alameda Historic District as having five important visual and spatial axes:

> a north-south axis on Second (Lexington Avenue) and Third (Saratoga Street) Streets connecting the gate house (Buildings 30 and 31) with the Headquarters Building (Building 1); a strong east-west axis, connecting Buildings 2, 3, 4 on the west with Buildings 16, 18 along Third Street (Saratoga Street); strong axes along the edges of the hangars, on First Street (Monarch Street) and Avenue F (Tower Avenue); and informal, non-orthogonal axes at the edges of the residential area.[220]

The guide further defined four core sub-areas within the base: the Administrative Core; the Hangars Area; the Shops Area; and the Residential Area (**Illustration 10**).
The Administrative Core is bounded by Avenue A (Red Line Avenue) on the north; Fifth Street (Pan Am Way) on the east; First Street (Monarch Street) on the west; and Avenue C (Midway Avenue) on the south. The Hangars Area frames the west and south sides of the historic district, facing First Street (Monarch Street) to the east and Avenue F (Tower Avenue) to the north.[221] The Shops Area is bounded on the west by First Street (Monarch Street), on the east by Fifth Street (Pan Am Way), on the south by Avenue F (Tower Avenue), and on the north by Avenue C (Midway Avenue). The 1997 guide did not further define the boundaries of the residential area, except that it is composed of informal, non-orthogonal axes. Overall, the guide focused on describing historic and functional subareas of NAS Alameda and the main axes of the base plan, rather than specific definition of the boundaries of the historic district.

The 2007 Historic Properties Inspection Report and the 2008 National Register Nomination, both prepared by Jones & Stokes, used the historic district boundary created by Woodbridge with the four sub-areas created by Mikesell to describe the NAS Alameda historic district (**Illustration 11**).

The current study has revisited the district boundaries and makes recommendations for changes in Section 5.

4.3. Specific Buildings Evaluations Under World War II-era Context

The "Specific Buildings Evaluation" refers to those buildings and structures constructed before 1946 that had not been previously evaluated, or that had received insufficient evaluation in previous surveys. These facilities were reconsidered by this study for their potential NRHP eligibility, either as individual properties within the context of World War II, or as a potential contributor to the NAS Alameda Historic District.

The evaluation of these resources followed the National Park Service guidance, specifically *National Register Bulletin 15*, and the statewide guidance for military properties. The evaluations are organized by resource name on DPR 523 forms in **Appendix C**.[225] Please note, **Appendix C** has sequential page numbers. **Tables B-7** and **B-8** include page numbers for **Appendix C** and provide lists of the DPR 523 forms by building numbers and resource names for quick reference. To facilitate record keeping and assist readers in understanding previous building evaluation, the site record form completed by Woodbridge in 1992 and applicable sections from the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda

[223] Mikesell, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 3.
[224] Jones & Stokes, "Historic Properties Inspection Report for the Naval Air Station, Alameda Historic District, Final" Figure 3; and "Pre-Final National Register of Historic Places Nomination for the Naval Air Station Alameda Historic District," sketch map.

Historic District" are attached to update forms. The Woodbridge form provides the basis for the re-evaluation of buildings and the Guide indicates previously identified character-defining features. Character-defining features are further identified on the current forms.

4.3.1. Specific Buildings Evaluation NRHP Evaluations under World War II Context

The buildings and structures of the Specific Building Evaluation were evaluated for potential significance under NRHP Criteria A and C (CRHR 1 and 3) within the period of significance from when construction of the station began in 1938 to the conclusion of World War II in 1945. None of the Specific Building Evaluation resources appear to be historically significant individually within the context of NAS Alameda's initial development or use during World War II. The potential significance of these resources lay in their possible contribution to the NAS Alameda Historic District. As discussed in Section 5, the district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development. Under Criterion A, JRP evaluated the Specific Building resources to assess whether they contributed to the historic district and its important association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and important associations with the Navy's role in Pacific theater naval operations during World War II. Under Criterion C, JRP evaluated these resources to assess whether they contributed to the historic district and its distinctive characteristics of type, period, and method of construction, particularly in support of district's design and planning that embody the strategic development for naval air stations and for the important role the station's design had in support of naval air power during World War II. In addition, JRP assessed whether Specific Building Evaluation resources retain sufficient historic integrity to convey their significance to the historic district's period of significance.

Other than the thirteen buildings and structures newly identified that contribute to the historic district, the remainder of the Specific Building resources either did not have sufficient historic significance to be considered a contributor to the historic district or they lacked sufficient historic integrity. Some resources lacked both historic significance and integrity to the district's period of significance. There are also areas containing World War II-era resources adjacent to the historic district that include buildings / structures that have been moved or altered, and that have considerable post-1945 construction interspersed among the older buildings. Such areas were not considered to have sufficient historic integrity to be included within the boundaries of the historic district. Many of the ineligible resources served functions on NAS Alameda before and during World War II, but did not contribute to the significance of the station and understanding

the historically significant themes noted above. Many were simply part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, these buildings and structures did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although some retain integrity, they are generally unremarkable in terms of their use in routine operations and fleet support, and were not historically important within the context of the station or within the larger historical context of development of the station. Most of these buildings and structures are utilitarian in design, materials, and construction methodology, and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These facilities have no direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Please note, there are resources on NAS Alameda that have some similar historic associations as those resources that are considered NRHP eligible; however, if they are not among the 13 new contributors to the historic district, the conclusion of this report is that they do not retain sufficient historic integrity to convey their significance.

4.4. Cold War Evaluations (including resources from Specific Buildings Evaluation)

The current study also evaluated all buildings and structures constructed before 1989 for potential eligibility for listing in the NRHP (and CRHR) for associations with the Cold War (1946-1989). These evaluations were conducted because previous studies did not address this potential period of significance. The evaluations also establish whether or not any of the facilities built during the latter part of the Cold War era met NRHP Criteria Consideration G, for properties less than fifty years old (and similar special consideration under CRHR). Furthermore, the evaluations considered whether or not each building or structure met the criteria for listing in the NRHP as an individual property, or as a potential contributor to the NAS Alameda Historic District. The Cold War Evaluation also considered whether or not a Cold War-era historic district existed on NAS Alameda, independent of the existing World War II-era historic district. As with the Specific Building Evaluation, the Cold War Evaluation of these resources took into account National Park Service *Bulletin 15* and the Statewide Study.[226]

The Cold War evaluations are also organized by resource name on DPR 523 forms located in **Appendix C**. As noted, Appendix C has sequential page numbers. **Tables B-7** and **B-8** in **Appendix B** include page numbers for Appendix C and provide lists of DPR 523 forms by building numbers and resource names for quick reference. To facilitate record keeping and assist readers in understanding previous building evaluations, the site record form completed by

[226] CFR Title 36, Part 60; *National Register Bulletin 15*, passim; JRP, "Historic Context: Themes, Property Types, and Registration Requirements."

Woodbridge in 1992 and applicable sections from the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" are attached to current relevant DPR 523 forms. The Woodbridge form provides the previous evaluation for the World War II era. Combined, the two forms create a full evaluation of the buildings and structures from construction through the end of the Cold War. The Guide indicates previously identified character-defining features. Character-defining features are further identified on the current forms.

4.4.1. Evaluations under National Register Criteria

The evaluation of resources on NAS Alameda within the context of the Cold War took into account the Statewide Study, which presents important Cold War themes. Within the Statewide Study, Cold War themes fall within two general categories: the "high technology" themes that define much of the significance of the achievement of California military bases during this period; and the more routine thematic areas, such as training and support, which have typified the role of California military installations for more than a century. Within the "high technology" themes, the sub-themes are: weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, and man in space sites. Examples of NRHP-eligible Cold War military properties in California under these sub-themes include: Michelson Laboratory at Naval Air Weapons Station China Lake; Test stands of the Air Force Research Laboratory at Edwards Air Force Base (AFB); and Atlas, Titan, Minuteman, and Peacekeeper launch facilities at Vandenburg AFB. The emphasis on non-routine, leading edge technology, while consistent with the requirements to establish exceptional significance, can lead to a biased presentation of the history of the military during this period. The vast majority of men and women who served in the military during the Cold War, as well as the majority of civilian employees at California bases, were involved with so called "routine" functions. The use of the term "routine" does not imply that these people were not doing vital or crucial work. Rather, the emphasis upon non-routine leading-edge developments is pursued in recognition of the historically significant aspects of Cold War-era history, as well as the higher burden of proof that is required in determining NRHP eligibility for properties that may have achieved significance during the last 50 years. Within the Cold War themes, routine sub-themes include: support for troops overseas, total Army and Navy coordination of Regular Forces, Reserve, and National Guard, and a separate theme of military architecture of the Cold War era. At the time of publication of the Statewide Study in 2000, no military properties within the sub-themes of support for military personnel overseas and total Army and Navy coordination of Regular

Forces, Reserve, and National Guard, had been found to be eligible to qualify for listing in the NRHP.[227]

NAS Alameda continued to support carrier operations in overseas conflicts, and other overseas operations, during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. The historical record did not illustrate a direct link between specific development, building / structure construction or alteration, or shift in station planning tied to specific operations. Cold War resources on NAS Alameda served general support functions for the fleet and its personnel. The history of the station during the Cold War, therefore, illustrates that neither the historic district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes.

None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Navy operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and naval facilities around the nation.[228] Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period.

None of the facilities evaluated within the context of the Cold War, therefore, meet the criteria for listing in the NRHP or CRHR because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). These resources do not exemplify important types, periods, or methods of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). None of the buildings or structures on NAS Alameda has historic significance within the Cold War period of operations or functions of the station. This applied to buildings and structures considered individually on NAS Alameda, as well as to any potential collection of resources on station. The lack of significance of the station during the Cold War in general, and of the separate buildings and structures on

[227] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, California Historic Military Buildings and Structures Inventory (prepared for United States Army Corps of Engineers, 2000), 8-1 to 8-60.
[228] JRP, "Historic Context: Themes, Property Types, and Registration Requirements."

NAS Alameda, supports the conclusion that a distinguishable entity that has a significant concentration, linkage, or continuity of resources for a Cold War-era historic district does not exist on this facility.

4.4.2. Exceptional Importance under Criteria Consideration G.

Some of the properties evaluated by this study were built after 1960 and are less than fifty years old. These resources were not only subject to the thresholds of significance (evaluation criteria, registration requirements, and program comments) described above, but were also subject to NRHP Criterion Consideration G for properties less than fifty years old. NRHP guidance dictates that properties less than fifty years old can only be eligible for listing if they: 1) meet one or more of the NRHP criteria of significance; 2) retain historic integrity; and 3) are of "exceptional importance," the latter of which would require sufficient historical perspective and scholarly research to consider and provide an extraordinary level of significance. The properties on NAS Alameda dating to post 1960 fall within the context of the Cold War, and were evaluated for potential important associations within this context (see Section 4). While NAS Alameda served a vital support function during the Cold War era and there is sufficient historical perspective to evaluate these resources, none of these facilities rose to the level of exceptional importance as required to meet NRHP Criterion Consideration G (and similar CRHR special consideration).[229]

[229] JRP, "Historic Context: Themes, Property Types, and Registration Requirements."

5. CONCLUSIONS

This report contains two categories of conclusions. Buildings and structures constructed before 1946 that had not been previously evaluated or received insufficient evaluation were reconsidered for potential eligibility either as individual properties within the context of World War II, or as possible contributors to the NAS Alameda Historic District. The second set of conclusions considered the eligibility of all buildings constructed before 1989 for listing in the NRHP for associations with the Cold War (1946-1989). Conclusions regarding the historic significance and integrity of the cultural landscape on NAS Alameda are discussed in the Cultural Landscape Report, prepared under separate cover.[230]

Woodbridge previously identified the NAS Alameda Historic District in the 1992 report "Historic Architectural Resources Inventory for Naval Air Station, Alameda." The current study of pre-1946 buildings included preparation of updated DPR 523 forms, but did not reconsider eligibility of buildings and structures already identified as contributors to the NAS Alameda Historic District. JRP surveyed and evaluated a total of 442 resources on NAS Alameda for the combined studies in this report. None of resources evaluated in the combined studies appear to be individually eligible for the NRHP or CRHR. Of the total, 105 resources constructed prior to 1946 were surveyed and evaluated. Of the studied buildings and structures, there are 99 contributing and 57 non-contributing buildings and structures located within the historic district boundaries, with another 286 non-eligible buildings and structures located outside the historic district. This study identified 13 new contributors to the NAS Alameda Historic District, and recommends expanding the historic district boundaries (**Table 20.**) (See also **Table B-5** and **B-6** in **Appendix B**).

The NAS Alameda Historic District is eligible for listing in the NRHP under NRHP Criteria A and C (CRHR 1 and 3) with a period of significance from when construction of the station began in 1938 to the conclusion of World War II in 1945. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development. The historic district and its contributors retain sufficient historic integrity to convey their collective significance to the period of significance. The NAS Alameda Historic District, however, does not have important associations with historically significant themes of development during the Cold War period.

[230] The findings and conclusions from combined the Specific Buildings Evaluation / Cold War Evaluation will be synthesized with the findings and conclusions of the Cultural Landscape Report in the National Register nomination form that will be prepared for the NAS Alameda Historic District.

Under Criterion A, the NAS Alameda Historic District is significant because of its important association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the Navy's role in Pacific theater naval operations during World War II. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention given to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. The district in general and its contributing elements provide a direct link to Navy's initial development of NAS Alameda and the station's support of a central and vital role in the Pacific theater.

Under Criterion C, the NAS Alameda Historic District is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation.

One of the most striking and refined details of the station's design is the use of Moderne style architecture for the prominent buildings. The use of this style architecture aligns with, and is an excellent example of, several architectural trends of the period. The station's architecture is an important illustration within California military facilities of the continued use in federal architecture of classically-inspired proportion and symmetry while reducing overt historical reference in ornament and style. The station's Moderne design also corresponds with the use and integration of streamlined geometry and form into architecture during the 1930s, as well as

prominent use of modern construction materials, which highlights the modernity and technological advances of the period. The use and refined execution of the Moderne style on NAS Alameda is important within the context of California military facilities and is an central component of the historic significance of the NAS Alameda Historic District.

Completion of the station plan was sped up and successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional layout enabled the station to rapidly expand to serve and support this important wartime activity. The NAS Alameda Historic District does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

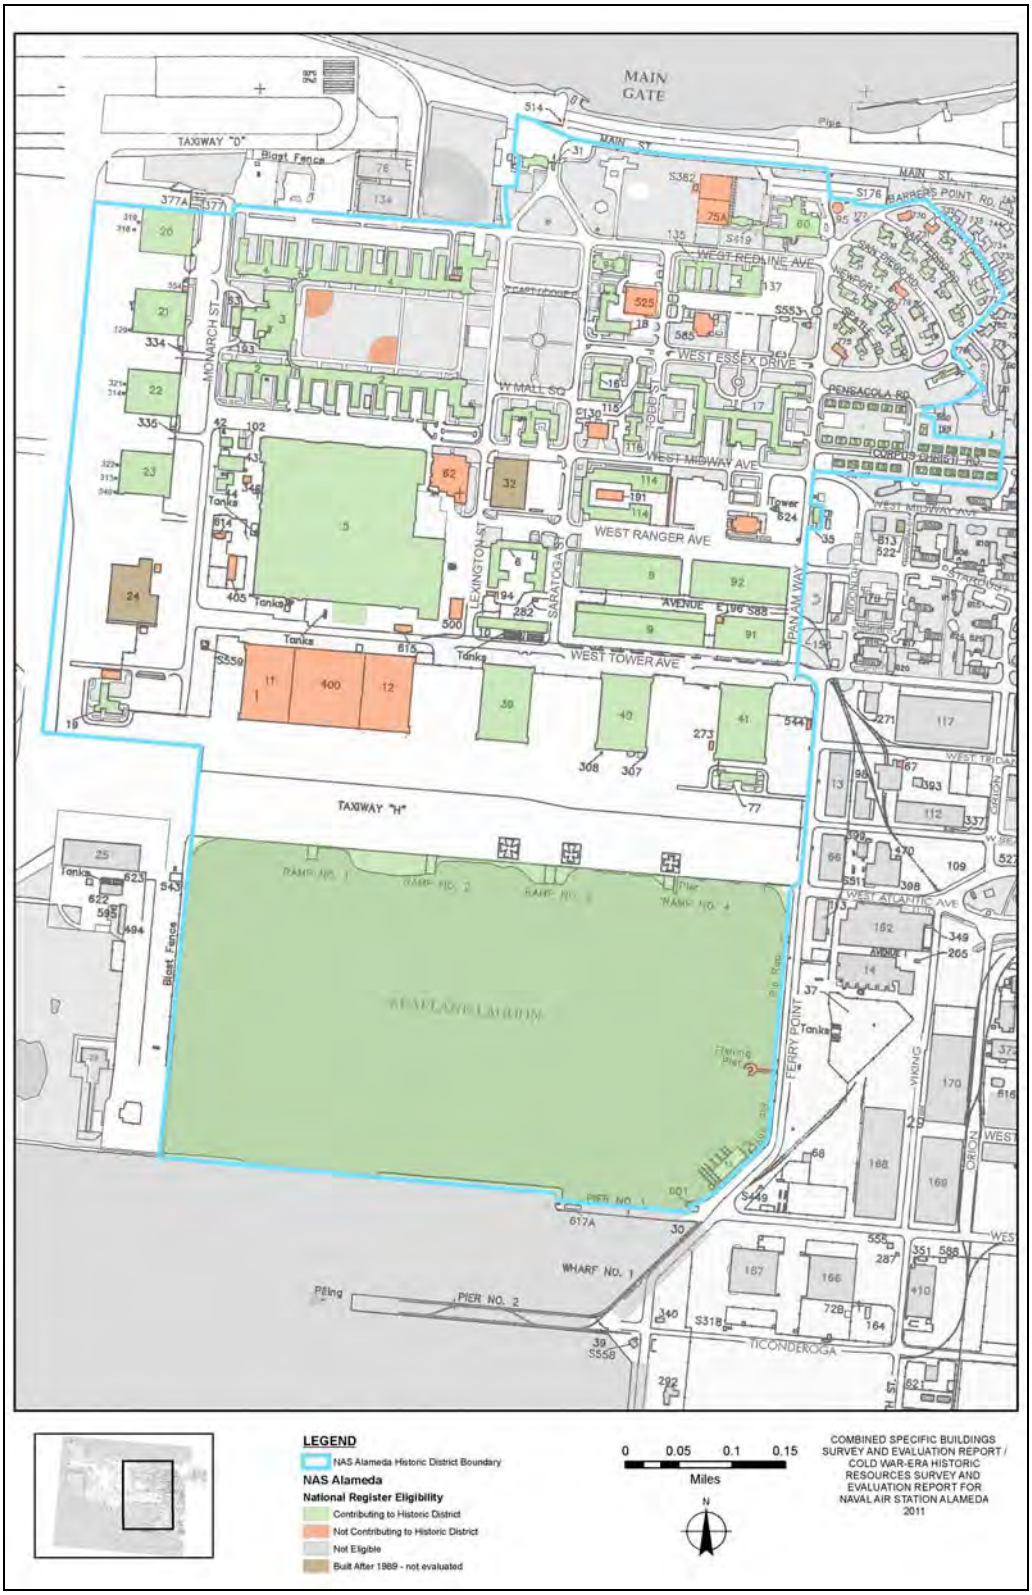
In addition to its historic significance, the NAS Alameda Historic District also retains a high degree of historic integrity to convey its significance. It has the physical features that relate to its period of significance (1938-1945), and it retains elements of all aspects of integrity: location, design, setting, materials, workmanship, feeling, and association. The 13 new contributors to the NAS Alameda Historic District all retain historic integrity to convey their significance. There are resources on NAS Alameda that have some similar historic association as those resources that are considered NRHP eligible, however, as noted in Section 4, if they are not among the 13 new contributors to the historic district, the conclusion of this report is that they do not retain sufficient historic integrity to convey their significance.

The following is a summary table of the 13 new contributors to the NAS Alameda Historic District. This is followed by an illustration of the historic district, summaries of the evaluation of the 13 new contributors, and a description of the historic district boundaries. The full evaluations are in the DPR 523 forms in **Appendix C**, which also include discussion of the character-defining features of the historic district contributors.[231]

[231] The character-defining features of the NAS Alameda Historic District were previously identified and discussed in: Stephen Mikesell (JRP Historical Consulting Services), "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

Table 20. Contributors to the NAS Alameda Historic District Identified in this Report

Building Number	Historic Function	Year Built
No Number	Seaplane Lagoon	1940
5	Overhaul and Repair Shops	1940
10	Power Plant Building	1940
15	Boathouse	1940
19	Control Tower	1941
35	Radio Transmitter Building	1940
64	Boiler / SIMA Diving Locker	1941
Ramp 1	Seaplane Ramp #1	1940
Ramp 2	Seaplane Ramp #2	1940
Ramp 3	Seaplane Ramp #3	1941
200648	Bulkhead	1938
200650	Jetty	1939
200687	Seaplane Ramp #4	1940



NAS Alameda Historic District, as defined by this report.

Building 5: The previous evaluation of the Assembly & Repair Shops concluded that the building did not retain historic integrity to the historic district's period of significance (1938-1945). Research revealed that additions and modifications to the buildings were constructed during the period of significance, and thus Building 5 retains historic integrity. Building 5 was one of the central and most important functions on NAS Alameda, contributing significantly to the station's overall purpose and to its war time effort. It is prominently located within, and thus illustrates, the station's orthogonal formal design, and it has similar architectural features to the station's hangars and thus contributes to the Moderne style architectural character of the historic district. Furthermore, the additions to the building reflected the growth of A&R on NAS Alameda during World War II and the adaptation of the facility to meet the demands imposed by the war.

Building 10: Similar to Building 5, research revealed that the Power Plant retain historic integrity to the historic district's period of significance, with the expansion of the building in 1945. This expansion had been previously been noted as having been constructed after World War II. The Power Plant had a crucial function on the station, its location highlighted the design and organizational design of the station, and its expansion reflected the growth and adaptation of the station during World War II.

Building 19: The previous evaluation of the Control Tower concluded the building had lost historic integrity to the historic district's period of significance. Re-evaluation of this building now concludes that it retains sufficient historic integrity to be a contributor to the historic district. The Control Tower was the central facility for aircraft operations and has primary significance for its association with the historic district's importance in naval air station development and the role NAS Alameda served during World War II. The building also shares character-defining features with the administrative core and shops on NAS Alameda. This evaluation led to reconsideration of the district boundaries, which were expanded to include the Control Tower.

Building 35: The previous evaluation concluded that Radio Transmitter Building was ineligible as a contributing element of the NAS Alameda Historic District because the addition on the south end of the building was considered compromising to its historic integrity. Research revealed that the southern addition to the building was constructed between 1942 and 1943. Thus the building retains integrity to the period of significance. The building contributed to important communication functions during World War II. It is also illustrative of the evolution in the station's formal layout and design, and it contributes to the architectural character of the historic district with its Moderne style elements.

Seaplane Lagoon and Constituent Elements: The Seaplane Lagoon and other contributing elements that are constituent elements (Seaplane Ramps 1 through 4, Bulkhead, and Jetty) of the Seaplane Lagoon are significant for their important role in supporting seaplane operations and its association with the development of NAS Alameda and its important associations with the station's role in Pacific theater naval operations during World War II. The Seaplane Lagoon contributes to the historical association of operations before and during World War II, and it is a significant component of the station's overall design and layout. This evaluation led to reconsideration of the district boundaries, which were expanded to encompass the Seaplane Lagoon.

Buildings 15 and 64: Buildings 15 and 64 are situated in the vicinity of the Seaplane Lagoon and within the expanded historic district boundary. They are significant within the historic district because of their importance to waterfront operations. They also contribute architecturally to the district in a manner similar to some industrial buildings and the siting of these two buildings reflects the station's important design and layout that took into account the local conditions of this facility.

The boundary of the NAS Alameda Historic District is as follows. The northern boundary of the historic district extends east from the parking area adjacent to the Main Gate along the northern edge of the station on Main Street and then south to the north edge of the landscape area around Building 95. The boundary line extends east to the northwest side of where San Pedro Road meets Barbers Point Road. The line extends northeast along the northern side of Barbers Point Road, heads southeast along the east side of Pearl Harbor Road, and then southwest on the east side of Essex Drive. The boundary encompasses a portion of the lawn on the east side of Quarters A's driveway and follows the fenced yard of Quarters A southeast, nearly to Lemoore Road, then southwest nearly to Pensacola Road. The line then encompasses the yard of Chief Petty Officer housing unit 7 and continues east along the northern edge of the yards of Chief Petty Officer housing units 25-29. The boundary then turns south, crossing Corpus Christi Road, and then west along the back yards of Chief Petty Officer housing units 14-24. Upon reaching Pan Am Way, the line extends south along the east side of Pan Am Way, deviating south of Midway Avenue to include Building 35. The boundary then continues along the east side of Pan Am Way following the southern edge of the curve as Pan Am Way transitions to Ferry Point Road. The line continues south along the west side of Ferry Point Road moving further west at a point south of Atlantic Avenue to exclude the angled parking adjoining the road. At the northern edge of Pier 1, the boundary turns west excluding the pier, but includes the jetties forming the southern edge of the Seaplane Lagoon. The line extends up the west side of the Seaplane Lagoon, jogs to the west on the north edge of Taxiway "H" and continues west from Monarch Street toward the Airfield along the edge of the former taxiway to encompass Building 19. The

boundary extends north along the east side of Taxiway 4 to the northern edge of Building 20 and heads east along the northern edge of Red Line Avenue and heads north, encompassing the landscaped area adjacent to Lexington Avenue and along the west edge of Building 30 including the associated parking lot north of the Main Gate. Thus completes the boundary of the historic district as defined by this report (See **Figure A-5 Appendix A** for a comparison of the previous and current district boundaries).

As for the Cold War period, the history of the station during the Cold War illustrates that the NAS Alameda Historic District, its contributing elements, or any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and naval facilities around the nation.[232] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. The resources on NAS Alameda, including the NAS Alameda Historic District, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or historically significant individuals of that era (NRHP Criterion B / CRHR Criterion 2). The buildings structures on NAS Alameda do not exemplify an important type, period, or method of construction of the Cold War-era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

There is one additional resource on NAS Alameda that has historic status. The Pan Am China Clipper commemorative monument located near Building 1 is California Registered Historical Landmark No. 968. Although the monument does not meet NRHP eligibility criteria, it was automatically listed in the California Register and carries Status Code "1CL" in the California Historic Resources Information System.[233]

[1] While the fieldwork for this evaluation report was being conducted, Buildings 309-312 were demolished under the Navy's Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) program, specifically as a part of the Time Critical Removal Action (TCRA) for Sites 5 and 10 Storm Drains. The Navy coordinated this action with SHPO and consulting parties in September 2009.

The 800 Storage (Buildings 618 and 619) are not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because they do not possess historic significance under the NRHP or CRHR criteria. (See Continuation Sheet.)

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Both buildings were constructed in 1982 to serve as industrial materials storage facilities and both have housed industrial chemicals. The buildings appear unchanged and have not been moved from their original location at the southern end of the naval base.[2]

Evaluation

Buildings 618 and 619 were constructed during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time as storehouses. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the storage function of Buildings 618 and 619 did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although they retain a measure of integrity from when they were constructed, they were

unremarkable in their use in routine fleet support, and were not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda buildings are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These buildings are typical of Cold War-era storage facilities located on military bases. These buildings do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Buildings 618 and 619 are not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Lastly, though the buildings appear to retain integrity to their period of construction, their use was unremarkable in support operations of the station.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Buildings 398 and 470 have been grouped together in this form because of Building 470s support function for Building 398. Building 398 is an irregular shaped two-story building measuring 31,894 square feet with a flat roof. It is primarily comprised of two roughly rectangular elements: one is the south element, which is on an east-west alignment fronting West Atlantic Avenue and the other is the north element, which is attached to the north side of the first element on a north-south alignment. The north element is an addition built in 1968 **(Photographs 1 and 2).** (See Continuation Sheet.)

***P3a. Description (cont.):**

The south element fronting West Atlantic Avenue has corrugated metal walls on a concrete foundation. On the south side are two metal roll-up doors and three metal personnel doors with single lights. Another metal roll-up door is on the north side. Attached to the south wall of this element is a small raised ridge metal addition. The addition also has two metal roll-up doors and a single metal personnel door with a single light. Another small addition constructed of concrete block is attached to the north wall of this element. It has several sets of metal double doors sheltered by a cantilevered metal roof. Several louvered vents are set in the walls of this component of Building 398 **(Photograph 1)**.

The north element of the building also has corrugated metal walls set on a concrete foundation. On the first floor are several sets of metal double doors on the east and north sides. Some of these have single lights. A single metal personnel door is on the second floor of the north side and is reached by a metal stairway. Attached midway on the east wall of this component is a cantilevered metal roof **(Photograph 2)**.

Building 470 is a small one-story, prefabricated, raised ridge metal building set on a concrete foundation covering 384 square feet. It has a front gabled, raised ridge metal roof with a low pitch. A double hinged shed door opens on the east side. There are two boarded up window openings on the south side **(Photograph 3)**.

B10. Significance:

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Buildings 398 and 470 did not have a direct or important role in NAS Alameda's operations nor did they make a significant contribution to the understanding of these roles during the Cold War era.

Building 398 was constructed in 1957 by contractors Swinerton & Walberg of Oakland with A&E services by Kaiser Engineers as a permanent compressor building. The building was designed and constructed to provide facilities for testing and overhauling cockpit cooling turbines, air turbine starters and motors, gas turbine compressors and power units. The building consisted of a 78 x 60 foot air turbine testing area and a 100 x 100 foot area for air turbine overhaul with a total of 11 test cells within the 23,000 square foot structure. The original design of the building was an 'L' shape in order to provide for rapid expansion if the need should occur.[1]

In 1968 the building was expanded in order to modernize the rework facility to keep pace with the ever increasing workload as one of only two overhaul facilities in the United States and the West Coast's only test facility designated for pneumatics components rework. Isodore Thompson Company of San Francisco was contracted for the

engineering design of the expansion and Page Construction Company of Novato constructed the building. Building 470, the air vacuum pumping station, was relocated to its present location when foundation was laid for the expansion at the east side of the original building. The building was expanded 8,000 square feet for rework and testing with a 6,000 square foot shop with 50 work benches as well as four test cells for gas turbine compressors, auxiliary power packages, and cabin air compressors. The building now totaled 31,000 square feet with 15 test cells.
In 1991, the northern projecting part of the building roof was enclosed with corrugated metal panels which was previously exposed piping.[2]

Evaluation

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 398 and 470 were built during the Cold War-era operations on NAS Alameda, and are part of the broader fleet support functions of the station during this period. Buildings 398 and 470, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they does not have direct or important associations with either the important events or trends of that era (NRHP Criterion / A CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). The buildings played a supporting role of the Public Works function in the operations of the station, but while they served this function on NAS Alameda during the Cold War era -- they did not play a significant role in their research, design, testing and evaluation, functions that might have imbued it with exceptional significance. Thus, while they retain some integrity to when they were constructed, these resources were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Furthermore, while Buildings 398 and 470 served a necessary function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

***P3a. Description (cont.):**

As Building 400 is newly recorded, but inseparable from Buildings 11 and 12, an update form has not been used. The Building 11 and Building 12 components of the complex are virtually identical and are described together; the Building 400 component is described individually. Additionally, the Building 400 component of the complex was built in phases with the northern portion referred to as Building 400 and the southern portion referred to as Building 400A.

Buildings 11 and 12 are three-story components of approximately 91,000 square feet each with a rectangular plan on a concrete foundation and concrete walls. They have a very low-pitched gable roof with a central clerestory. The facades face east and west, respectively, and are anchored at the corners by stout piers accented by bands that run the full width of the buildings (**Photograph 2**). The sides of these buildings were altered when Building 400 was constructed in between Buildings 11 and 12. Building 400 was constructed in two phases: construction on the northern half (known as Building 400) began in 1955, and construction of the southern half (known as Building 400A) began in 1957 (see Sketch Map). When Building 400 was constructed the northern pylons of Buildings 11 and 12, and the hangar doors and hangar door frames adjacent to Building 400, were removed. In contrast, the pylons on the south end of Buildings 11 and 12 adjoining Building 400A partially remain, and portions of hangar doors on Buildings 11 and 12 are extant on the interior of Building 400A.

The east and west facades of the Building 11/12/400 complex are dominated by walls of sliding hangar doors made up largely of industrial sash windows. A shed roof with composition shingles shelters the doors. Inset on the hangar doors of each building are personnel doors north and south of center and two pairs of strap hinge doors. The north and south sides of the building are two stories with a set-back third story. They each have horizontal bands of three-by-four and four-by-four window sets. The third story and roof clerestory have continuous bands of these windows. On the first floor are metal personnel doors with single, double, or multi-lights windows; one has louvered vents (**Photographs 2, 3 and 4**).

The Building 400 component (including the 400 and 400A portions) is connected to Building 11 on the west and Building 12 on the east (**Photograph 5**). It is about 126,000 square feet with a roughly square plan on a concrete foundation and concrete walls. The Building 400 component's south side has a large six-paneled sliding hangar door with sets of four-by-four industrial sash windows. Metal personnel doors with windows are in each panel. Also on each end are external metal ladders with cages that run from the ground to the roof. The north side of the Building 400 component has a long, metal cantilevered roof suspended by cables. The roof shelters two metal roll-up doors and a raised, flush loading dock with two-part metal door. There are also four pairs of metal personnel doors with windows. High on the wall is a discontinuous ribbon of windows which have been boarded over. Centrally located on the north side a square, tower-like element of the building rises above the plane of the roofline. Several small louvered vents are placed sporadically on this side (**Photograph 6**).

The interior of the Building 11/12/400 complex, as illustrated by the photos of Building 12 on this form, is characterized by expansive hangar and industrial areas with reinforced walls and ceiling (**Photograph 7**). The buildings include various crane and manufacturing mechanisms attached to a network of crossbeams dropped below the ceiling. Industrial pipes and vent structures along the interior walls reflect the industrial nature of the buildings, but were likely modified through the history of the buildings (**Photograph 8**). Additional features are the pocket hangar doors that ran along tracks inlaid in the concrete floors. The construction of the Building 400 component was a significant change that impacted Buildings 11 and 12, and the changes remain visible on the interior of the complex (**Photograph 9**). The hangar doors of Building 11 and 12 adjacent to the Building 400 infill are partially visible on the interior of the Building 400A portion, but they are no longer extant on the interior of the Building 400 portion.

B10. Significance (cont.):

This form was prepared to provide additional information about Buildings 11, 12, and 400, to assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of

Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. BuDocks used these principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, and included hangars where Buildings 11 and 12 were built.[3]

H. Mayson of Los Angeles constructed Building 11 in 1941 for $550,000. That same year Building 12 was constructed for $551,440. The Navy constructed both as seaplane hangars as part of the original station plan to serve as aircraft maintenance and rework hangars under the direction of the A&R Department, which became the Overhaul and Repair (O&R) Department. Air stations constructed at this time tended to use standard hangar plans known as B-M Landplane Hangar and B-M Seaplane Hangar. Buildings 11 and 12 use this general plan although their measurements are not standard. They were among the first buildings constructed on the station to accommodate the maintenance of the seaplanes stationed on NAS Alameda. Seaplanes played a prominent role in the Navy at this time and the construction of these hangars before landplane hangars indicates their importance in the early development of the base. Additional services included decal fabrication on the second floor of Building 11 and administration offices on the second floor of Building 12.[4]

The development of new technology associated with faster aircraft resulted in the need for new facilities to relieve overcrowding in the O&R department during the 1950s. As part of a development project funded by the BuDocks, the Navy proposed Building 400 occupy the space between Hangars 11 and 12 as the Electric and Electronic Overhaul Building. The firm of Swinerton and Walberg of Oakland began construction of Building 400 in 1955, with an original estimate of $2,000,000. This quickly increased to almost $2,500,000 and took over two years to complete owing to plan revisions that incorporated a high bay area (enclosed hangar) between Buildings 11 and 12 and additional shop spaces for highly-classified electronic equipment. A second increment of Building 400 began in 1957, Building 400A, and was completed the following year; it added a third story to the northwestern corner of the new building and completing the bay area on the first floor. Construction of the first phase included the removal of the northern pylons and hangar doors on the sides of Buildings 11 and 12 adjoining the Building 400 portion. Construction of the southern high bay retained the Building 11 and Building 12 pylons adjacent to the Building 400A portion. However, the characteristic hangar doors adjoining the Building 400A portion were obscured. The second floor of the Building 400 component included clean rooms for reworking aircraft components along with photo and pressure labs, and microprocessor facilities, while the third floor housed the Avionics Test and Repair facilities. This building brought together many facilities that were previously dispersed across the base. By consolidating the

processes, skills and equipment, the Navy hoped to attain better quality control and improved production to accomplish their assigned station mission in a much more efficient manner.[5]

In August 1960, owing to concerns of debris in San Francisco Bay, the Navy relocated Alameda's last squadron of seaplanes to Puget Sound Navy Yard in Bremerton, Washington, bringing an end to the seaplane era on NAS Alameda.[6] This change in technology and aircraft based on NAS Alameda resulted in a shift from seaplane maintenance and repair to broader aircraft reworking within Buildings 11 and 12, following the application of the new addition, Building 400. In 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy. Thereafter, the Building 11/12/400 complex came under new departmental supervision, but retained their purpose as aircraft reworking facilities. Building 400, the Avionics Building, received new ultra-clean rooms during the administrative overhaul. Building 11 continued to house aircraft maintenance component shops, such as fiberglass facilities located in the north-central section and a metal working shop in the southeast corner. Building 12 focused on elements of aircraft overhaul and included a pneumatic oxygen shop in addition to administrative services.[7]

During the 1970s missile repair and rework undertaken in Building 400 was expanding beyond the building's capacity. Funding restraints prevented the construction of a new building for a few years before Building 530 was constructed in 1975 to take over that function. In the meantime operations expanded to multiple established facilities on the station.[8]

The Navy made few external improvements to Buildings 11, 12, and 400 since the 1950s. The most significant change to the original buildings is the addition of Building 400 between Buildings 11 and 12 and its two-stage construction, which altered the area from a former airplane apron to additional rework and avionics facilities. Since construction, the Navy has replaced some windows and metal personnel doors on the complex. Additionally, the complex underwent unspecified renovations in 1991.[9]

Evaluation

Although construction of Buildings 11 and 12 in 1941 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District, the two formerly individual buildings have been heavily modified through the addition of Building 400 and thus do not have the historic integrity to convey their potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity prevents the Building 11/12/400 complex from conveying sufficient

architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[10]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Buildings 11 and 12 were placed in the latter category because of the infill construction of Building 400 that was considered an alteration that diminished the integrity of Buildings 11 and 12 such that the formerly individual buildings (now joined) did not contribute to the district.[11] Research undertaken for this project in building plans, base maps, and aerial photographs confirmed that Buildings 11 and 12 were originally constructed during the period of significance and the addition of Building 400 from 1955 to 1957 greatly diminished the historic integrity of the older buildings. Buildings 11 and 12 were constructed as a part of the original station plan and were based on standard plans of the time; however, characteristic hangar doors have been removed or obscured and pylons were removed as a part of the construction of Buildings 400 and 400A. The Building 400 component of the Building 11/12/400 complex also fills the area between the two hangars and is taller than the older buildings, thus altering the relationship between Buildings 11 and 12, as well as to the other three hangars along the seaplane lagoon. As a result, the Buildings 11 and 12 do not retain integrity of design, setting, materials, workmanship and feeling, and are not contributors to the NAS Alameda Historic District. The addition of Building 400 altered the integrity of design and feeling of Buildings 11 and 12 because they no longer retain their original massing and proportion, like the other seaplane hangars, and they do not read as individual buildings within the row of buildings along the north edge of the Seaplane Lagoon. The alteration of the relationship between the two buildings also affects the integrity of setting. The building complex is distinct from the row of seaplane hangars and their even spacing. The addition of building 400 resulted in the removal and concealment of characteristic features of Buildings 11 and 12, thus diminishing their integrity of material. The assaults on the integrity of Buildings 11 and 12 sufficiently diminish the complex's ability to convey its association with the context of naval air stations built in 1930s and World War II, and thus the Building 11/12/400 complex is not a contributing element of the NAS Alameda Historic District.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions

in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[12] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 11, 12 and 400 housed maintenance and repair functions for deployed aircraft, missiles and components and were not involved in the development, testing and evaluation of new technologies. These activities were in support of overseas activities but not significantly distinguished from activities performed by other air stations across the country. Although the complex of buildings retains integrity to the Cold War period, Buildings 11, 12 and 400, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHP Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.&2. Historic/Current name: Buildings 20, 21, 22, 23, 11-400-12, and 39, 40, 41,
Aircraft Maintenance Hangars.
3. Locations: Hangars 20-23: First St.; Hangars 11-400-12 and 39-41: Ave. F
NAS Alameda Map J-M-19, P-21-26 City: Alameda Zip: 94501 County: Alameda Code:001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: Two-story, concrete structures with metal frames and roof trusses that define a bowed roof concealed behind roof parapets. The hangars have rectangular plans and were built in two sizes: Hangars 20-23 are 254 ft. by 213 ft. by 40 ft. high; Hangars 11, 12, and 39-41 are 321 ft. by 242 ft. by 50 ft. high. Large, rectangular corner piers rising to the height of the parapet enframe the ends of the buildings. The piers are off-set from the facade and a metal shed-roof extends across the wall to shelter the sliding metal hangar doors which have solid lower sections and glazed, multiple-light upper sections. The eaves of the shed-roof are tied visually to the corner piers by a scored band around the piers. The other building elevations are stepped back above the second stories. Below the set-back, the walls are fenestrated with bands of metal-framed windows with 12-light sash on the upper story and, on the lower story, continuous metal-framed doors and windows that also form a complementary band. The tops of the walls are capped with dark bands as are the piers.

HISTORICAL INFORMATION

14. Construction dates: Hangars 11, 12, 20-23, and 40 - 1941; Hangar 39 - 1944;
Hangar 41 - 1945 Original location: yes
15. Alterations: The area between Hangars 11 and 12 was infilled with Building 400 in the postwar period. The other hangars appear unaltered.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic Attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally
developed: yes

19. Context: With the exception of Hangars 11 and 12, which have lost integrity because of infill construction, the aircraft hangars contribute to the NAS Alameda Historic District under Criteria A because they were constructed during the period of significance as part of the central core and, for the most part, strongly enforce the impression of the naval air station as an historic setting. Architecturally, under Criterion C, these are handsome structures that exhibit the stylistic traits of the early Modern style of the period in their cubistic forms, unifying detail such as the banding of openings and the scored lines on the piers, and fenestration.

Buildings 338A-H are not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because they do not, individually or as a group, possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

***P3a. Description (cont.):**

Buildings 338A-H were originally 32 buildings in eight groups of four buildings was erected end to end and spaced 30 inches apart in a rectangular footprint.[1] They are connected by a 30 inch x 30 inch steel duct which serves as a vent between buildings **(Photograph 2)**. Personnel as well as metal roll-up doors are generally accessed by some type of concrete or wooden dock or stairs. Some of these entrances also have a cantilevered overhang and most areas used as offices have windows as well **(Photographs 3 and 4)**.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. These buildings are not eligible for listing in the NRHP or CRHR because they do not, individually or as a group, possess historic significance under the NRHP or CRHR criteria. The buildings did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did they make a significant contribution to the understanding of these roles during the Cold War era. Although Buildings 338A-H were part of NAS Alameda's Assembly & Repair (A&R, later Overhaul and Repair, or O&R, and Naval Aircraft Rework Facility, or NARF) operations, particularly with regard to aircraft preservation and storage, these buildings were not engaged in historically significant naval missions and activities.[2]

Buildings 338A through 338H are referred to as "cans," and are metal shipping containers that were assembled and converted in 1948 for plane and equipment storage, Buildings 338A and 338C were used as office space. Prior to the placement of these containers, this area was used for aircraft parking. [3]

Aircraft maintenance, repair and overhaul remained a major station mission. The immediate task following World War II was maintenance and preservation of aircraft returning from the Pacific Theater. Excess aircraft were preserved for storage. Naval personnel constructed and installed special containers on base for preservation of inactive aircraft.[4] Preservation of the aircrafts primarily took place in Buildings 166 and 167 while chemicals were stored and used in Buildings 410 and 351.[5]

When the containers were assembled 1948, there were 32 metal cans available for storage or office space. By the 1960s six of the containers had been removed. The layout of the cans remains much the way it did when altered in the 1960s; however, the surrounding area has changed, as several more storage containers have been added.[6] Currently the site is used as commercial storage.

Evaluation

Buildings 388A-H were built during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] In the larger context of the naval operations in California and nationwide during the Cold War, the O&R function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The buildings are unremarkable in their use in routine fleet support, and are not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology (NRHP Criterion C / CRHR Criterion 3). While they were used in an untraditional way, the buildings are simply steel storage containers. This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

***B10. Significance: Theme:** **Area:**
Period of Significance: **Property Type:** Airfield / Seaplane Facilities **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The Airfield with all of its attendant elements does not appear to meet the criteria for listing in the National Register of Historic Places (NHRP) or the California Register of Historical Resources (CRHR) within the context of NAS Alameda's use before and during World War II or during the Cold War. The Navy constructed the Airfield as part of NAS Alameda's initial development and it played an important role in the operations of the station during World War II. Subsequent alterations to the Airfield, however, considerably impacted its historic integrity to convey significance associated with the World War II period, and thus it is not a contributing element to the NAS Alameda Historic District (NRHP eligible), which is significant for the station's construction and use during the war. For the Cold War period, the Airfield is not known to be associated with any historically significant event(s) or individual(s). Furthermore, neither the design nor the construction of the Cold War-era Airfield exhibits the historical significance required to qualify the Airfield for listing on either the NHRP or the CRHR. Moreover, while the Airfield served a valuable function on NAS Alameda during the Cold War era, its alterations and use were not of exceptional importance as required for properties that have achieved significance within the past 50 years NRHP Criterion Consideration G (and similar CRHR special consideration). (See Continuation Sheet.)

P3a. Description (cont.):

The elements of the Airfield inventoried and evaluated on this form are as follows: [1]

Resource	Historic / Common Name	Year Built
Building 100	Transformer Vault	1942
Building 259	Rinse Facility	1983
Building 377 Complex (includes Building 377A and an unnumbered wooden structure)	Aviation Fuel Ready Room	1954
Building 407	Liquid Oxygen Facility	1957
Building 480	Tetrahedron	1942
Building 488	Compass Rose	1944
Building 489	Compass Rose	1944
Building 499	Field Lighting Vault	1964
Building 513	Wheels Up Landing Aid-R/W 31	1964
Building 514	Wheels Up Landing Aid-R/W 25	1964
Building 200642	Runways	1952
Building 200649	Seawall	1947
Building 200689	Runway Lighting	1954
Building 201061	Taxiways	1952
Building 201087	Runway Lighting	1954
Building 201191	Aircraft Parking Apron	1945
Building 201194	Taxiway Lighting	1954
Building 201196	Obstruction Lights	1946
Building 201201	Beacon Lights	1946
Building 201210	Runway	1952
Building 201224	Aircraft Maintenance Apron	1941
Building 201242	Aircraft Operational Apron	1959
Building 201244	Aircraft Open Storage	1941
Building 201253	Runway 13-31	1952
Building 201254	Runway 7-25/L-R/	1952
Building 201256	Taxiways	1952
Building 201258	Aircraft Maintenance Apron	1941
Building 201260	Aircraft Parking Apron	1945
Building 201489	Approach Lighting	1964
Building 201543	A/C Access Apron	1942
Building 201544	A/C Holding Apron	1959
Building 201545	A/C Arming / De-arming Pad	1941
Building 201546	A/C Beacon	1942
Building 201547	R/W Distance Markers Lighted	1957
Building 201549	R/W Guidance Lighting System	1965
Building 201550	Center Line R/W LGT	1965
Building 201551	Wheels Up-Wave Off Lights	1965
Building 201711	Helicopter Landing Pad	1970

[1] Available base mapping does not illustrate where all of the structures associated with these building numbers are located. Nevertheless, the historic function of the structures (listed in the table above and taken from a provided properties database) together with fieldwork and historical research suggested that all of the above structures were elements of the Airfield; they are included in this single recordation. Where possible, locations and specific construction and use histories of the above list properties are given in the text below.

P3a. Description (cont.):

The NAS Alameda Airfield is partially enclosed by seawalls (Building 200649) of rip-rap stone and concrete (**Photograph 2**), and it consists principally of runways, taxiways, and a large concrete apron area. The system of seawalls includes 1,750 linear feet on the north edge of the Airfield along the Oakland Inner Harbor that was built as a part of the Army Corps of Engineers Training Wall between 1874 and 1896. This structure was previously determined eligible for the NRHP in a separate report. This portion of the seawall was not rerecorded or reevaluated as part of this DPR 523 form.[2] The runways are: Runway 13-31 (Building 201253) and Runway 7-25/L-R/ (Building 201254). Runway 13-31 is 7,600 feet long and 200 feet wide. It follows a diagonal northwest-to-southeast line, with Runway 13 (**Photograph 3**) in the northwest and Runway 31 in the southeast. Runway 7-25/L-R/ is 662 feet long and 200 feet wide.[3] It follows an east-west line, bisecting Runway 13-31 near the beginning of Runway 13 in the northwest corner of the Airfield. Runway 7 (**Photograph 4**) is located on the west end and Runway 25 is located on the east end. These runways are paved with asphalt over a concrete base and have concrete pads (with no asphalt) at either end. Various lights have been installed on the runways; such lights include elevated beacons at the end of the runways (**Photograph 5**) and smaller rotating lights along the edges (Buildings 200689 and 201087) (**Photograph 6**). Along the runways are remnants of aircraft emergency arresting gear (**Photograph 7** and **8**). This system of runways and taxiways supplanted the earlier World War II system, portions of which remain as a large area of concrete apron. This earlier system is discussed in the historic context below.

Near the ends of the two runways are additional buildings: two "wheels up-wave off lights" buildings and an aviation fuel complex. The "wheels up-wave off lights" buildings are Building 513 and Building 514. Building 513 is located on Building 512, an L-shaped fixed dolphin located at the south end of Runway 13-31 (**Photograph 9**); Building 512 is recorded on a separate form. Building 513 has a square plan building with shed roof and two fixed pane windows on the northwest corner. The west side windows are boarded up. The south and east sides were not accessible at time of survey (**Photograph 10**). Building 514 is located in an enclosed area north of the Main Gate to NAS Alameda, several yards away from eastern end of Runway 7-25. It is a one-story, rectangular building. Its nearly-flat shed roof has a metal flange and an antenna is mounted to the south side of the building. On top of the roof are two red lights. There are two doors located on the east side of the building, and boarded-up windows on all four sides. A set of concrete stairs descends from the doors on the east side. The building rests on skids placed on a concrete foundation (**Photograph 11**).

South of Taxiway D and adjacent to Landplane Hangar 20 is the aviation fuel complex: Building 377 and Building 377A, and single un-numbered wooden structure. Building 377 has a rectangular plan and a shed roof; it was constructed of concrete block. Fenestration on the south and east sides include four-light windows. The west side has two personnel doors, a six-light window, and three boarded-up windows **(Photograph 12)**. West of Building 377 is Building 377A. Building 377A appears to be a temporary building and is resting on wooden beams. Rectangular in plan, it is clad in horizontal channel rustic wood siding with a gable roof of corrugated metal. The front gable doorway is boarded up as is a window on the east side **(Photograph 13)**. The unnumbered wooden structure is located to the west of Building 377A and likewise appears to be rectangular in plan with horizontal channel rustic wood siding with a shed roof (**Photograph 14**).

Running to, from, and along the runways are seven concrete taxiways – identified on base mapping as Taxiways B, C, D, E, F, G, and H. Taxiway B, also known as Taxiway 50 (Building 201256) starts at Runway 7, running south and west of the runway before intersecting with Runway 13-31 (**Photograph 15**). Taxiway C (**Photograph 16**) runs diagonally southeast at the beginning of Runway 13 before first turning further southward and running parallel to the

[2] "Primary Record, Alameda Training Wall, Naval Air Station, Alameda," JRP Historical Consulting Services, 1996. Building 200649 appears to be an accounting tool to record the structures on NAS Alameda. Records do not indicate construction of seawalls in 1947, and the length 30,146 feet is sufficient to encompass the station and include walls engulfed in subsequent fill.
[3] Runway measurements provided in Runway 13-31 and Runway 7-25/L-R/, U.S. Navy, *NAS Alameda Internet Naval Facilities Assets Data Store (iNFADS)*, 2008.

runway; it ends at an intersection with Runway 7-25. Taxiway D begins at Runway 25 and curves south and then west to connect with Taxiway E. Taxiway E follows a north-south line, perpendicular to Runway 7-25 and parallel to the apron area (to the west) and the Landplane Hangars (to the east) before terminating at Taxiway H. Taxiway F (**Photograph 17**) intersects Taxiway E at roughly midpoint, and then runs east-west perpendicular to Taxiway E and through the apron area. Taxiway G begins at Runway 31, following a diagonal southwest to northeast line that terminates at Taxiway H. Taxiway H, the longest taxiway, runs east-west, bisecting Runway 31 on its way to the eastern edge of the Seaplane Lagoon. At the westernmost end of Taxiway H is a helipad.

The concrete apron – comprised of a number of smaller individual concrete spaces designated for aircraft parking, maintenance, calibration, arming / de-arming, storage, and holding – encompasses the area located at the intersection of Runway 13-31 and Runway 7-25 (**Photograph 18**) as well as area bordering the west side of Runway 13-31. Prior to the lengthening and expansion of the Airfield in the early 1950s, the apron area was smaller, confined largely to a triangular area fronting current Taxiway E; a concrete curb distinguished the apron area from runways. A remnant of that curb can be found on the current, expanded apron area near Taxiway F (**Photograph 19**).

Of the small concrete spaces that make up the apron, three are readily identifiable: two compass roses (Buildings 488 and 489) and the rinse facility (Building 259). One of the compass roses (Building 488) is located near the eastern end of Taxiway F (**Photograph 20**), while the other (Building 489) is located near the intersection of Taxiway E with Taxiway H (**Photograph 21**). The rinse facility is located southeast of the second compass rose (Building 489) (**Photograph 22**). Eight rows of covered metal drainage system runs east to west and a single drainage grate runs from north to south between two three-sided concrete sidewalls that measure approximately three feet in height at the center decreasing to one foot at the sides **(Photograph 23**). Three concrete boxes are located at the northwest corner outside of the structure (**Photograph 24**).

In addition to these concrete spaces, there are a number of distinct buildings, structures, and objects associated with the Airfield on the apron: the tetrahedron (Building 480), a liquid oxygen facility (Building 407), a field lighting vault (Building 499), and a transformer vault. The tetrahedron is located on the apron, west of Runway 13-31 (**Photograph 25**). It is sheathed in aluminum, balanced on a concrete base on a metal pivot post and weighted on one end.

The liquid oxygen facility is located southeast of the tetrahedron and northeast of the rinse facility. It is a concrete block building with a low-pitched gable roof. The northeast side has a pair of six light fixed metal windows and a two light window. The southeast side is fenced in and appears to be plain. The southwest side has a metal personnel door and a pair of six light metal windows with an operational awning. The northwest side has a six light window flanked by a metal personnel door on the southeast and a sliding metal door to the southwest. The building is painted airfield red and white. The liquid oxygen facility is adjacent to Building 272, a temporary structure that was relocated to the airfield in the 1950s and is recorded in separate form (**Photograph 26**).

The field lighting vault is located northeast of the liquid oxygen facility and southeast of the compass rose. It is a one-story concrete tilt-up structure measuring 46 feet long by 31 feet wide with a low pitched gable roof located at the southeast corner of the old runway system and aircraft apron. The southeast side has a double metal delivery door on the east end with a four-light personnel door and exterior equipment to the south. The southwest side has a single louvered vent. The northeast side has a four-light metal personnel door, a panel of four louvered vents with exterior equipment in front at the north end and a single louvered vent on the east end. The northwest side has a panel of four vents and exterior equipment in the gable. A large roof vent is located on the northwest side (**Photograph 27**).

The transformer vault is located northeast of the rinse facility. It is a rectangular bunker with a flat roof and L-shaped plan. Two roof vents are located on the south end. Constructed of board formed concrete, half of the structure is sunk in the ground. A concrete ramp leads to the sub-grade entrance on the east side with double metal personnel doors

with side walls that angle from high to low and capped by a shed flat roof. The north side has external piping that connects to underground utilities. The remaining walls are plain (**Photograph 28**).

B10. Significance (cont.):

Historic Context

The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country during the mid to late 1930s. During World War II, NAS Alameda was effectively adapted to support naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to serve and support its important wartime activities. NAS Alameda was one of three major air stations on the west coast to support operations of aircraft carrier groups, patrol squadrons, and utility squadrons, and it conducted crucial functions for aircraft assembly and repair. Following naval aviation's successes in World War II, the Navy established the aircraft carrier as a central basis for naval operations, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. NAS Alameda supported carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, and continued to carry out its main function of aircraft overhaul and repair. Much of the focus for military development during the Cold War, however, was on research and development of innovative aircraft and weapons. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of Cold War naval missions and activities.

As military tension around the world increased in the late 1930s, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur J. Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. The assertive conclusion of the Hepburn Report in 1938 was that the need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning. The Hepburn Board recommended establishing NAS Alameda as one of the major air stations on the west coast supporting both operations and aircraft assembly and repair (A&R). NAS Alameda, along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program, although Congress had already approved funding for NAS Alameda in 1937.[4]

The NAS Alameda Airfield was a central component of operations on the former naval facility from the 1940s to the closure of the station in 1997. Although the first experiments in Navy aviation began in the 1910s with land-based airplanes, seaplanes – aircraft that could operate directly from the sea, also known as flying boats and floatplanes – were initially envisioned as the most logical application of the new technology to Naval missions. By the 1950s, however, jet aircraft operating from naval air stations and carriers had outstripped seaplanes in importance.[5]

Webster, United States Army Construction Engineering Research Laboratory, "Historical and Architectural Overview of Military Aircraft Hangars," Prepared for United States Air Force Headquarters, Air Combat Command, 1999 revised 2001, 3-41 and 3-43; JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 1-1; Jones & Stokes, "Pre-Final National Register of Historic Places Nomination for the Naval Air Station Alameda Historic District" (prepared for Naval Facilities Engineering Command, Southwest and Base Realignment and Closure Program Management Office West, January 2008), 8; and Allbrandt, "History of the Naval Air Station and Naval Aviation Depot at Alameda, California" (May 1996), 2; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 229.

[5] David W. Wragg, *Boats of the Air: An Illustrated History of Flying Boats, Seaplanes, and Amphibians* (London: Robert Hale, 1984), 15-4770, 73, 102, 160; and LCDR B.L. Allbrandt, "History of the Naval Air Station & Naval Aviation Depot at Alameda, California" (unpublished manuscript, 1996), 7.

From the outset, the Airfield, with its runways, taxiways, apron areas, and other associated elements, was a vital component of the overall design of NAS Alameda. The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[6] The station's original design received an award for functional planning at the Seventh Annual Architectural Exhibition of the Association of Federal Architects in Washington D.C. in 1939.[7] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. BuDocks and the design team utilized standardized designs for some building that we developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. Following the Hepburn Report, BuDocks and BuAer further refined standards and requirements for naval air stations. However, local conditions necessitated alterations for improved functionality at given locations.[8] NAS Alameda followed many of the standards and requirements of the period. Yet, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report.

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period planners located piers, seaplane functions, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. As a result of this organization, naval air stations designed and built in this period share similar organization. This can be seen in the comparison of the general layout of NAS Alameda and NAS Jacksonville, both designed and built in the years starting in the late 1930s. Landing areas for both land and seaplanes are at the edges of the bases. Hangars, both seaplane and land plane, adjoin the landing areas.

The NAS Alameda base plan also had a comprehensive aesthetic design, in addition to its functional organization. The City Beautiful movement heavily influenced planning in the United States in the first half of the twentieth century, and can be seen in city planning as well as institutional settings such as college campuses. The movement borrowed planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, which were employed on NAS Alameda. Various *partis* or shapes, such as courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new

[6] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[8] Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70.

bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [9]

BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes. In these early plans, the north-south axis ran from the north entry gate, bisected the entry mall and Building 1, and terminated at the center line of the Seaplane Lagoon to the south. The original east-west axis bisected an open area separating the living quarters / administrative core from the shops and operational portion of the station, and was aligned with the middle of the Airfield on the west end of the station. The operational areas like the Airfield were sited either directly on the axial line or paralleled an axis.

The Airfield's original layout was nearly bilaterally symmetrical to the building area of the station to the east, with area measuring roughly the same as Shops and Administrative Core areas of the station. The Seaplane Lagoon was subject to similar axial and proportional considerations. As a result, the original Airfield was nearly the same size as the core of the station and the original Seaplane Lagoon.

Natural conditions where the station was being constructed and the Navy's focus on seaplanes meant that construction of the Airfield lagged beyond construction of facilities for seaplanes. The tideland at the furthermost western end of Alameda was the planned site for the Airfield, but much of the area had to be filled in before it could be properly paved for runways and taxiways. Necessary fill came largely from dredging of the Seaplane Lagoon, begun in 1938. While the Seaplane Lagoon was substantially complete by 1940, dredging for the airfield continued until September 1941. Even as more fill was applied to the Airfield area, construction of the runways commenced in April 1941; five runways, two taxiways, and a warming-up apron were not complete, however, for another eight months.[10]

Once completed, the Airfield from above resembled a capital "I" superimposed over a capital "X." Two runways, 8-26L (or N) and 8-26R (or S), ran west to east and formed the top and bottom bars of the "I." Both were 500 feet by 4,000 feet, and were adjacent and parallel to the north and south boundaries of the Airfield. A single, north-south runway, 17-35, formed the center bar of the "I." It was 500 feet by 3,800 feet and ran between Runways 8-26L and 8-26R. Two northwest to southeast and southwest to northeast runways, 12-30 and 3-21 respectively, formed the "X." Both were 500 feet by 3,800 feet and ran diagonally between Runways 8-26L and 8-26R. Two taxiways ran east-west and north-south. The east-west taxiway was 75 feet by 1,390 feet, and extended from the warm-up apron at the eastern end of the Airfield to the intersection of the five runways. The north-south taxiway was 200 feet by 1,100 feet; it was positioned parallel to the eastern boundary of the Airfield and perpendicular to the east-west taxiway. The triangular warm-up apron, approximately 1,630 feet by 800 feet, was located on the eastern boundary of the Airfield adjacent to Landplane Hangars and divided roughly in half by the east-west taxiway.[11]

Although the Airfield was not fully complete until November 1942, operations commenced in December 1941 with the entry of the United States into World War II following the Japanese attack on Pearl Harbor. Additional work was performed on the Airfield in the 1940s to meet the exigencies of war, and continued well into the 1950s to response to advancing technologies in the Cold War era. During World War II, installations were largely focused on the apron

area east of the runways. In 1941, a concrete arming / de-arming pad (Building 201545), an open storage area (Building 201244), two maintenance aprons (Building 201224 and 201258), and a transformer vault (Building 100) were built. The transformer vault, constructed by Johnson, Drake and Piper, housed transformers, electrical switches, and a duplicate of the Runway Lighting Control Panel located in the Control Tower. Connected to the tower by a field phone, the vault was intended to act as a backup system in case the lighting control panel was inoperable. In 1942, the tetrahedron (Building 480), two compass roses (Buildings 488 and 489), and access aprons (Building 201543) were added. The tetrahedron served as a wind direction indicator for aviators in case of Control Tower radio silence, while the two compass roses were magnetic "dead" zones used for calibrating airplane compasses. In 1945, another parking apron was constructed. Between 1942 and 1954, more than 250,000 feet of lighting was installed at the Airfield's runways (Building 200689 and 201087), including obstruction lighting (Building 201196) and an aircraft beacon light (Building 201546). In 1948, a permanent lighting system was installed for the taxiways, and more lighting was added in six years later (Building 201194). In 1942, 1945, and again in 1955, nearly 830,000 square yards of the runways were paved as were more than 170,000 square yards of taxiways.[12]

In the postwar period, the Airfield was substantially altered to accommodate jet aircraft. Heavier and faster jet-powered planes required a greater stopping distance than NAS Alameda's runways – designed and built for the propeller aircraft of the 1930s – could permit. Requests to lengthen the runways were first made in 1945 and appeals continued until 1951 when Congress appropriated funds for a naval runway expansion program.[13]

The runway improvements, part of a $270 million project to update runways at 32 Naval Air Stations and Marine Corps Air Stations to accommodate jet aircraft, largely obliterated the original Airfield. While the Navy's new jet runways tended to be shorter than those of the Air Force (which were likewise being constructed during this period), the overall design and composition of the runways on NAS Alameda – particularly with the use of concrete – was similar. An initial $2.8 million project strengthened and lengthened the northernmost east-west runway (Runway 8-26L), creating the new Runway 7-25R; Runway 8-26R was later re-designated Runway 7-25L. Construction of Runway 13-31, a new southeast-northwest runway, required additional fill between the seaplane lagoon and western edge of the runway. Stolte Co. and Gallagher & Burke Co. were jointly granted the $3 million contract. Runway expansion required additional infill to stabilize the runways for the heavy aircraft. By the end of 1951, the contracting companies had only completed the sub-grade for Runway 13-31; however, within the next year, several new taxiways were built. In January 1955, the 800-foot southern extension of Runway 13-31 was finished, with the seal, paved shoulders, and drainage completed later that year. In August 1957, additional dredging and seawall construction west of the Seaplane Lagoon was completed to support the extension of Runway 25L; that same year, runway distance markers (Building 201547) were lighted. Four years later, in 1962, the remaining portions of the original runways were designated as inactive and the current Airfield configuration was adopted. Portions of the older airfield runways

continued to be used as part of the apron area; aviators, for instance, would turn-off onto the old runway areas to run up aircraft engines and to swing aircraft compasses but they did not taxi on the old runways.[14]

The advent of jet aircraft not only impelled changes in the Airfield's design and configuration, but also prompted the installation of additional equipment and the construction of new buildings. In 1952, emergency arresting gear – modified from a similar mechanism installed on NAS San Diego and reminiscent of carrier arresting gear – was deployed on Runway 7-25. Two years later, Building 377 was constructed by Hagland Construction Company of Piedmont, California to serve as an aviation liquid fuel dispensary. It remained a tank truck or car loading facility until 1969, when it was converted for office use. In the late 1950s, Building 377A was built nearby. In 1957, the liquid oxygen facility (Building 407) was constructed on the east side of the Airfield. It stored both liquid oxygen and liquid nitrogen – both used as coolants and missile propellants – from 1957 up until 2001. Five years later, new emergency arresting gear, Type E-14 "Water Squeezer," was installed on Runways 13-31 and 7-25. Beginning in 1963 and continuing until 1965, a more elaborate system of runway lighting was installed; this consisted of approach lights (1964), "wheels up-wave off" lighting system (1964-1965), center line runway lights, and a runway guidance lights system (all in 1965).[15]
Two buildings, one near the south end of Runway 13-31 (Building 513) and one near the east end of Runway 7-25 (Building 514), were constructed in 1964 as part of the "wheels-up and wave-off" lighting system. The purpose of the system was to signal an aviators preparing to land at night if his aircraft's landing gear had been lowered. The wheels-up lights illuminated the underside of the aircraft to enable a wheels-watch stationed in the approach zone to determine if the landing gear was fully lowered. The watchmen on NAS Alameda was stationed in the small building located on the dolphin (Building 512) at the south end of Runway 13-31 with white approach lights on the dolphin.[16]

By the end of the 1960s, with the end of seaplane operations, the Airfield became the sole aviation landing platform. In January 1967, it was christened "Nimitz Field," in honor of Admiral Chester W. Nimitz, who died the year before.

Although concerns over noise and safety limited the majority of operations to Runway 13-31 by the early 1970s, beginning in the 1970s and continuing into the 1990s, additional repairs and alterations were made to the Airfield and its associated features. In 1970, a helicopter landing pad was constructed for rotary-wing aircraft. Thirteen years later, a rinse facility (Building 259) was built to wash aircraft; it remained in use until the base closure in 1997. In the 1980s, the unnumbered shed within the Building 377 complex was erected. By 1985, Runway 31 required extensive repairs that were completed June of that year; installation of new cabling for runway and taxiway lighting was begun in July, and in August, the long-delayed overlay of Taxiway 4 was completed. In 1992, the close-circuit TV system that served Runway 25 was completed with a Microwave Data Line. Additional paving repairs took place in 1993 along Runway 31, Taxiway C, and the aircraft parking apron near the Control Tower as well as on Runway 25. That same year, one of the compass roses was restriped as part of regular maintenance. In 1996, emergency pavement repairs were made to Runway 25.[17]

Evaluation

Despite its importance to former NAS Alameda, the Airfield does not appear to qualify for listing in the NRHP or the CRHR for either the World War II era or the Cold War era. As constructed between 1938 and 1942, the Airfield was an integral element of the design of NAS Alameda and it played a vital role in fulfilling the mission of the station during World War II. However, expansion of the runways and construction of new taxiways in the early 1950s to accommodate jet aircraft eliminated the original Airfield's runways and taxiways, obscured the Airfield's original design and considerably altered the Airfield's original configuration. Numerous equipment and lighting installations, building construction, and pavings made since the 1950s have further eroded the Airfield's design. Consequently, for the World War II period, regardless of any historically significant associations the Airfield might have – to an events (NRHP Criterion A / CRHR Criterion 1), an individual (NRHP Criterion B / CRHR Criterion 2), manner or mode of design or construction (NRHP Criterion C / CRHR Criterion 3) – it lacks the integrity necessary to illustrate those associations.

As for the Cold War period, the Airfield was redesigned as part of a broader effort to modernize military runways in California and nationwide. In this larger context, the Airfield did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Following its renovation in the 1950s it was unremarkable in its use and was not historically significant within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The Airfield and all of its attendant features, structures, and buildings are utilitarian in design, materials, and construction methodology and are relatively common for military airfields of the period (NRHP Criterion C / CRHR Criterion 3). No part of the Airfield is known to have a direct or important association with a historically significant individual, and no part is likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while Airfield served a vital function on NAS Alameda during the Cold War era, its construction and use – as well as the construction and use of its various features, structures, and buildings – is not of exceptional importance as required for

Base Directories, RG 181, NARA (San Francisco); and IT Corporation, "Zone Analysis Data Summary Phase 2A Sampling, Zone 4: The Runway, Alameda Point, Alameda, California. Contract No. 262474-93-D-2151. Delivery Order No. 0034." Submitted to Southwest Division Naval Facilities Engineering Command, January 2001; and Building 201711, *iNFADS*, 2008.

buildings, structures, and objects less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).[18]

As noted above, a portion of seawall at the northwest corner of the Airfield along the Oakland Inner Harbor, approximately 1,750 linear feet, were built as a part of the Army Corps of Engineers Training Wall between 1874 and 1896. This structure was previously determined eligible for the NRHP in a separate report. This portion of the seawall was not rerecorded or reevaluated as part of this DPR 523 form. The Training Wall does not gain any additional significance for its association with the Airfield, but retains its significance as previously determined. The Training Wall also does not confer any significance on the Airfield. Therefore, this evaluation excludes the previous-evaluated "Alameda Training Wall," which is a historic property. In 1997, the Navy concluded that the Alameda Training Wall was eligible for listing in the NRHP and the State Historic Preservation Officer (SHPO) concurred. The Alameda Training Wall is the south jetty of the Oakland Inner Harbor Jetties and Federal Channel Historic District, as referenced in the Navy's 1999 Memorandum of Agreement (MOA) regarding NAS Alameda.[19]

Period of Significance: **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

These ammunition lockers, Buildings 313, 314 and 316, are not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because they do not individually, or as a group, possess historic significance under the NRHP or CRHR criteria. Furthermore, they do not contribute to the significance of the NAS Alameda Historic District and are considered non-contributors to the district.

Buildings 313, 314 and 316 are located within the NAS Alameda Historic District identified by Sally B. Woodbridge in 1992 as a part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda"; however, these buildings were not evaluated using NRHP or CRHR Criteria as potential contributors at that time. Instead, Woodbridge concluded that they were among nondescript ammunition lockers, fuel storage drums and miscellaneous sheds that did not contribute to the historic district because of their temporary nature. This form was prepared to consider 1) re-evaluate the eligibility of these buildings within the World War II-era historic context for the station, assessing whether the building are historically significant and should be included in the NAS Alameda Historic District; 2) to provide additional information about the buildings to assess if they retain integrity; and 3) to evaluate the building's significance under Cold War themes.

B10. Significance:

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 313, 314, and 316 were all constructed by Johnson, Drake and Piper in 1942 as storage facilities for small arms and pyrotechnics. Buildings 313, 314, and 316 all appear to be variations on the Navy's "Standard Magazine for Pyrotechnics and Small Arms Magazine" plan.[1] That plan called for a single above-ground, reinforced-concrete rectangular magazine divided into two separate cells of equal size with steel doors. These three buildings, instead of being joined were spaced apart. By 1963, these buildings had been enlarged to 12 feet by eight feet.[2]

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

Evaluation

Although construction of Buildings 313, 314 and 316 occurred during the original period of construction on the station, and the buildings fall within the period of significance for the NAS Alameda Historic District (1938-1945), the buildings are non-contributors of the NAS Alameda Historic District. The original discussion noted that "[t]he nondescript ammunition lockers, fuel storage drums, and miscellaneous sheds remaining from the period of significance are judged not to contribute to the historic district because of their temporary nature." Buildings 313, 314 and 316 were specifically listed as being among these non-contributing elements. Moreover, these buildings are undistinguished examples of a common building type and do not convey potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, their common utilitarian design prevents them from conveying any potential architectural design significance they may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

[1] R. Christopher Goodwin & Associates, Inc., Summary Report of Archival Research, Department of the Navy, Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974), October 2006, 27.

DEPARTMENT OF PARKS AND RECREATION **HRI#**
CONTINUATION SHEET **Trinomial**

Page 4 **of** 5 ***Resource Name or** # (Assigned by recorder) **#:** Ammunition Lockers – 1 Door
***Recorded by:** C. Brookshear and S. Miltenberger ***Date:** September 30, 2009 ☒ **Continuation** ☐ **Update**

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextual [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[3]

In addition, ammunition locakers on military bases are treated under a program comment. Because of the standardization and ubiquity of ammunition storage facilities on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district, and thus applies to the buildings recorded here. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of above ground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 313, 314 and 316, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

B10. Significance:

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 307, 308, 315, 219, 321, 322 were constructed in 1942 and served as storage facilities, but of different materials. Buildings 307 and 308 housed inert materials, Buildings 315 and 319 were small arms and pyrotechnics magazines, Buildings 321 and 322 were hazardous and flammable storehouses. The buildings continued to be used in these functions. The buildings were originally built with the same design as Buildings 313, 314 and 316 (recorded for this project on a separate form). The original design featured a single above-ground, reinforced-concrete rectangular magazine divided into two separate cells of equal size with steel doors. Research did not reveal when the additions were made to the buildings recorded here.[1]

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

[1] Department of the Navy, Bureau of Yards and Docks, *Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume IV, Districts 12 through 14, 1963*, Box 38, RG 8,CEC/Seabee Museum, NBVC, Port Hueneme, California; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 11: The Southern Hangar Zone, Parcel 53, 195, Building 307, 308, 309, 310, Alameda Point, Alameda California," January 2001; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 6: The Western Hangar Zone, Parcel 32, 190, 191, 192, Building 315, 319, 321, 322, Alameda Point, Alameda California," January 2001; United States Navy, *Internet Naval Facilities Assets Data Store (iNFADS)*, 2008.

Evaluation

Although construction of Buildings 307, 308, 315, 319, 321 and 322 occurred during the original period of construction on the station, and the buildings fall within the period of significance for the NAS Alameda Historic District (1938-1945), the buildings are non-contributors of the NAS Alameda Historic District. The original discussion noted that "[t]he nondescript ammunition lockers, fuel storage drums, and miscellaneous sheds remaining from the period of significance are judged not to contribute to the historic district because of their temporary nature." Buildings 307, 308, 315, 319, 321 and 322 were specifically listed as being among these non-contributing elements. Moreover, these buildings are undistinguished examples of a common building type and do not convey potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, their common utilitarian design prevents them from conveying any potential architectural design significance they may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextual [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[2]

In addition, Buildings 307, 308, 315 and 319 are treated under a program comment. Because of the standardization and ubiquity of ammunition storage facilities on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district, and thus applies to the buildings recorded here. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of above ground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic

nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 307, 308, 315, 319, 321 and 322, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

***P3a. Description (cont.):**

Building 263, located west of Building 67, is a corrugated metal hut with a concrete and asphalt floor, covering 850 square feet **(Photograph 3)**. The south side includes double solid metal doors with metal vent located above them. The north side has similar metal double doors, while the curved east and west sides have no fenestration.

Building 272 is located at the southeast corner of the old runway system and aircraft apron and Building 273 is located at the southwest corner of Building 41 facing the Seaplane Lagoon. Built on concrete foundations and clad in corrugated metal, both buildings measure 41 feet long by 20 feet wide covering 852 square feet, with two roof vents; however, Building 272 is 12 feet tall and Building 273 is 11 feet tall. Building 272 has a single personnel door on the southwest end and a round vent in the arch on the northeast end **(Photograph 4)**. Building 273 has a sliding metal door on the north and a louvered vent in the arch. The south end has a pair of hinged doors with a vent in the arch above **(Photograph 5)**. Two vents are located in the lower edge of the long side.

Building 337, measuring 40 feet long and 21 feet wide and covering 840 square feet, is located at the southeast corner of Building 112. The west side has a round vent near the curved roof. The north and south sides have two vents each near the base of the building. The east façade has a wide single metal door centrally located with an unused metal pipe track located above it **(Photograph 6)**.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 194, 263, 272, 273, and 337 are Armco Huts, similar in style to the Quonset Hut. Building 194 was constructed at its location in 1945 to be used as Public Works Storage. It has been used as a storage facility up to the present day. Buildings 272 and 273 were Armco huts constructed by Station Forces in 1945 as semi-permanent storage. Between 1963 and 1968 the buildings use changed from storage to a Liquid Oxygen and Nitrogen facilities in the 1960s and 1970s. Building 273 was also used as an airframes shop and aircraft maintenance shop. Station Forces constructed Building 263 as an aircraft ground support equipment shop. Although built as a temporary construction, Building 263 has remained adjacent to Building 63 and in use as an equipment shop from 1946 through base closure. Facilities Maintenance, its most recent occupants, used it to store lawn maintenance equipment, gasoline, and oil. When the base closed in 1997, Building 263 was classified as a ground support equipment shop. Building 337 is a pre-fabricated metal hut-type building constructed by Yard Labor in 1946 for storage at the southeast corner of Building 112. It was used for general storage purposes until 1972 when it housed hazardous

materials. Building 337 was most recently used as a chemical supply storehouse that contained adhesives, battery fluids, enamel paints, latex paints, gasoline, diesel, and oils.[1]

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

Thousands of Quonset huts were built in the United States starting in World War II. Their design was based on the Nissen Bow Hut first built by the British military during World War I. Named for their place of manufacture, the Davisville Construction Battalion Center at Quonset Point Naval Air Station, Rhode Island, several other companies became involved in manufacture of this building type including Stran Steel, the Anderson Sheet Metal Company and Armco International Corporation of Middletown, Ohio. Armco was the company that manufactured a heavy ingot iron building which was modeled on earth-retaining structures similar to storm sewers or culverts. Armco Huts were used for both ammunition magazines as well as personnel shelters. Armco Huts needed no rib supports and were strong enough to be buried under six feet of earth.[3]

Individual buildings constructed during the Cold War era, or World War II era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. This group of resources did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Evaluation

Buildings 194, 263, 272, 273, and 337 were built during World War II operations and immediately after the war, and are part of the broader fleet support functions of the station during this period and the subsequent Cold War era. In the larger context of the naval operations in California and nationwide during this period, the Public Works function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A /

[1] Buildings 272, 273, 337 Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; Department of the Navy, Bureau of Yards and Docks, *Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume IV, Districts 12 through 14, 1963*, Box 38, RG 8,CEC/Seabee Museum, NBVC, Port Hueneme, California; Department of the Navy, Naval Facilities Engineering Command, *Detailed Inventory of Naval Shore Facilities, Volume 5, Sec. 2, Naval Districts 11, 12 and 13 (Served by WESTNAVFACENGCOM), NAVFAC P-164, 30 June 1972*, Box 44, RG 8,CEC/Seabee Museum, NBVC, Port Hueneme, California; United States Navy, *NAS Alameda Internet Naval Facilities Assets Data Store (iNFADS)*, 2008; IT Corporation, "Zone Analysis Data Summary Phase 2A Sampling Zone 17: The Engine Testing and Hazardous Materials Storage Zone; Alameda Point, Alameda, California," January 2001.

[2] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

[3] Julie Decker and Chris Chiei, eds., *Quonset Hut: Metal Living for a Modern Age*. (New York; Princeton Architectural Press, 2005), 1-29, 149.

CRHR Criterion 1). Thus, while they retain some integrity to when they were constructed, these resources were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). As such, none are sufficiently significance to be considered contributors to the NAS Alameda Historic District.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 194, 263, 272, 273, and 337, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

***P3a. Description (cont.):**

The main entrance on the north side consists of a glazed personnel door with side and transom windows and a three-panel bay window to the west. South of the main building are three open brick bays, only one of which has a temporary flat, metal roof.

Building 608 A: This is a metal-framed, open bay currently used to store boats and cars. It has a north-south orientation with the bays opening toward the east. The roof consists of corrugated metal sheets supported by metal I-beams. The single corrugated metal wall is located on the west side.

Building 608 B: This is a rectangular shed open on the north side. It has corrugated metal sides and a corrugated metal roof supported by knee-braced I-beams placed in round concrete supports.

Building 608 C: Similar to Building 608 B, this is a rectangular shed with eight bays open on the west side. It has corrugated metal sides and a corrugated metal roof supported by knee-braced I-beams placed in round concrete supports.

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 608 and Buildings 608 A-C did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Page 4 **of** 7 ***Resource Name or #** (Assigned by recorder) Auto Hobby Shop

***Recorded by:** R. Herbert and K. Clementi ***Date:** October 8, 2009 ☒ **Continuation** ☐ **Update**

Construction began on the Auto Hobby Shop, Building 608, in 1979, resulting in a cost of $940,537; however, its grand opening did not take place until May 13, 1980. It was established to serve as a "self-serve" auto repair shop that included an internal sales area in addition to the two sides of vehicle bays. The bays are equipped with hydraulic lifts and the shop included muffler and metal machine shops. The building record notes alterations were made to Building 608 in 1982; however no notable changes could be discerned from aerial photographs. Buildings 608 A-C were constructed between 1985 and 1988 upon previously concrete paved areas. They serve as vehicle service bays. These bays are not fully equipped like those in Building 608, and they currently appear to serve more as storage bays than service areas.[1]

Evaluation

Building 608 and Buildings 608 A-C were built during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during the Cold War, the MWR function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The buildings retain some integrity to when they were built, but they are unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations of the period (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while the Auto Hobby Shop resources served a valuable function on NAS Alameda during the Cold War era, their construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Buildings 2 and 4 are contributing elements of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and have a NRHP status code of 2D2.

P1. Other Identifier: Buildings 2 and 4

P2e. Other Locational Data: Building 2 = Wing 1, 2599 Lexington St; Wing 2, 1025 Midway; Wings 3-7 1041 Midway; Wings 8-10 2550 Monarch. Building 4 = 2701 Lexington St; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The buildings remain a series of short north south wings connected by a long east west element facing a central courtyard. The concrete buildings have flat roofs with parapets and are two stories tall except for elements associated with the eastern most portion of the buildings. The buildings are large, enclosing 214,439 square feet for Building 2 and 228,881 square feet for Building 4. Building 2 includes Wings 1-10, Building 4 contains Wings 11-20. The eastern most wings (Wing 1, Building 2 and Wing 20, Building 4) have unique corner towers, additions and alterations so they can serve recreational and other purposes.

Typical wings have two bands of windows on the east and west sides **(Photograph 2)**. Each band has groups of two-over-two metal-frame windows with intervening concrete piers the same size as the windows divided to resemble window lights. The band has three groups of four windows with a group of three windows on either end. Closest to the connecting east-west element the east side of the wing has a group of windows consisting of a single window, a concrete dividing pier, and a pair of windows. The west side has a smaller window consisting of two single windows separated by a concrete pier. The outer end has an exterior metal stair with a single personnel door on each story leading to the stair. Facing the courtyard, wings extend slightly beyond the colonnade creating a regular rhythm **(Photograph 3)**. The second story has a continuous horizontal band with horizontal grooves like the bands seen on the side of the wings. At the sides, doors lead to the roof of the colonnade. On Building 2 the doors are solid with solid surrounds; Building 4 has metal frame glass doors with surrounding transoms and sidelights. On the front of the wings the bands curve to meet the slightly recessed windows. On Building 2 the end windows are mainly wood two-over-two windows with a pair on either side of a central grouping of four. Building 4 has metal two-over-two windows and have pairs on either side of a central grouping of three. The first floor has a wide opening to the colonnade with curved half columns on either side. Rectangular planters flank the concrete stairs leading to the wing entrance. Above each planter is a grouping of six small square openings creating a decorative pattern. The sides of the first floor are open to the colonnade. A pair of doors is located in the center of each wing set in an angled recess. A pair of windows is located to the west of each set of doors and a smaller narrow window is located to the east. Benches are built into the exterior porch wall below the decorative openings **(Photograph 4)**.

Alterations to this basic wing plan include replacement of the exterior stair on the outer end, common on Building 2. When the exterior stair has been replaced (Wings 8-10), the associated doors have also frequently been altered. Facing the courtyard, doors to the colonnade have been replaced and the second floor end windows have been replaced with sliding or fixed windows especially on Building 4, Wings15, 16 and 18. The east side of Wing 2 has small loading dock at the southern end with a metal door, and the first floor south door does not exist. Instead a group of six glass blocks is in the same location.

The long connecting element and associated colonnade runs along the courtyard side. The colonnade has three oval columns between each wing end dividing each section into four bays. Horizontal bands on the first and second floors contain groupings of four metal framed windows, as described for the wings. Facing away from the courtyard the connecting element has a central band of two groups of four windows separated by a decorative concrete pillar

(Photograph 5). On either side of the band of windows are a single window and a pair of windows without any decorative surround. On the first floor the eastern single window is replaced with a single door. A concrete stair with low concrete side rails leads to the door. Above the door is a curved cantilevered flat concrete overhang with horizontal metal band. The most common alteration is the filling of the doorway or addition of a second door. Doors have been removed or filled east of Wings 12, 15, 16, and 17. A second door was added between Wings 2 and 4.

The long connecting element has gaps between Wings 7 and 8 and Wings 13 and 14 where the colonnade branches and curves to meet Building 3 **(Photograph 6)**. The ends on either side of the break have a horizontal band consisting of a group of three windows flanking a single window. Flanking the courtyard the colonnade continues, but the back side is a poured concrete wall with rectangular unglazed, unframed, 'window' openings. Stairs lead through a rectangular opening away from the courtyard.

Wing 1 and Wing 20 have terminal towers at the end of the long connecting element **(Photograph 7)**. The square towers are three stories tall with a semi circle connecting the east side of the terminal wing with the tower. The east and courtyard sides of the tower have a central vertical recess from the second floor to the top. A single window is located at each level in this groove. Most appear to be replacements as the type varies. Rectangular openings are located on the first floor facing east and the courtyard providing access to the colonnade. A cast concrete planter surrounds the base of the tower and sports a concrete stylized Pegasus statue facing the courtyard.

Wing 1 is wider and truncated. A loading dock with freight elevator and refrigeration equipment is on the west side **(Photograph 8)**. Windows on the second floor include two grouping of four and two single windows. The east side has two bands of windows **(Photograph 9)**. The upper has four groups of four windows. The first story has the same openings but the windows have been replaced with fixed panes. A single story rectangular addition is placed at right angles to the wing. The north and south sides have high ribbon windows. Groups of three light windows are located on the west side. An entrance with a pair of glass doors is on the south. The doors are reached by a set of concrete steps flanked by planters and are sheltered by a flat metal roof with slender support posts. A small metal stair and single metal door is located on the north side.

Wing 20 is truncated with a two-story right angle addition and two one-story additions at the northeast and northwest corners **(Photograph 10)**. The north-south wing section has five groups of four windows in two bands along the east and west sides. The bands are disrupted on the west side by an exterior metal stair with metal doors on both stories. The two story addition has a large entry on the eastern end. A wide gentle ramp leads to a recessed doorway with curving sides. An arched awning covers the center of the ramp. The recess contains a pair of metal doors and a half window with bars. Above the entry is a lighted sign for the "Homeport Club." The south side has a metal stoop with a pair of metal doors. The west end has a central external metal stair from a door set in a group of six, four-light windows on the second floor. The first floor has similar fenestration without the door. The north side has a band of six groups of four light windows with intervening decorative piers on the second floor **(Photograph 11)**. These have been closed off from the inside as exposed by broken windows. The first story has a loading dock between the two additions. Two flat roofed refrigeration sheds are located on the dock. The rectangular addition on the northeast corner with a group of five windows on the east and single windows on the north and south ends. The northwest addition is larger. A single door with concrete stoop and curving cantilevered concrete overhang is on the north side flanked by small square windows divided into small lights. The east and west side have larger square windows with 48 small lights.

Buildings 2 and 4 have many similar interior elements that reflect their original design. Large portions of the buildings have been modified through the addition of offices and the subdivision of the dormitories, many divided

into cubicles such as those in Wing 4 constructed by a "self-help" project in 1980.[1] Many of the interior spaces have added drop ceilings. Although there were many changes to the interiors, some elements that are components of the buildings' Moderne style remain. Both buildings include large public spaces, such as lounges near the stairwells on the second floor that are characterized by the integration of the same horizontal bands that define the exterior of the buildings **(Photograph 12)**. The curved stairwells with their associated metal handrails also reflect the simplified Moderne style of the buildings **(Photograph 13)**. Throughout the history of Buildings 2 and 4, the Navy altered the open dormitories into semi-private rooms. However, some of these divisions were made through the addition of temporary cubicles **(Photograph 14)**. Another element to the dormitory spaces are the "mushroom" shaped concrete piers, which are original to the building and found within other buildings on NAS Alameda. Terrazzo flooring runs throughout most of these buildings, but may not be original to the buildings' construction. Additionally, the tile and marble elements, specifically those within the lavatories may originate with the buildings, but have since been partially demolished since the close of the building **(Photograph 15)**. A final construction element typical of the Moderne style found within the interior of the buildings are the rounded walls around the entries and doorways within Buildings 2 and 4 **(Photograph 16)**, which mimic the curved entries on the exterior. There did not appear to be many entries of this design within the buildings; however, there may be additional curved entries in the buildings which were not seen during field inspection.

Photograph 17: BEQ soon after completion in November 1941, oblique aerial view facing north.[2]

B10. Significance:

This update was prepared to provide additional information about Buildings 2 and 4, assess whether the buildings retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 2 and 4 were included in the original base plans to primarily serve as enlisted men's barracks. Construction began on eight wings of Building 2 in early 1938 as part of a lump sum $12,200,000 contract awarded to multiple companies working on the creation of the naval base. By the following year seven of the ten wings of Building 2 had

[2] "NAS Alameda, November 12, 1941 photograph," California- Alameda – pictures, maps, justifications, Record Group 5, Geographical Collection (1800-present), CEC/Seabee Museum, NBVC, Port Hueneme, California.

been completed. Johnson, Drake, and Piper ultimately completed both buildings in 1940; Building 2, with a capacity of 1465, was completed at a cost of $1,402,634.45, and Building 4, with a capacity of 1,545, was completed at a cost of $1,758,292.32.[3] The entrances to both buildings included marble Pegasus statues by Vermont Marble Company.

Building 2 has frequently contained various morale, welfare and recreation components along with housing enlisted personnel. In November 1940, the Dental Department temporarily set up in Wing 2 of Building 2. The dental offices remained there for two years before moving to permanent facilities in Building 16. In 1944 the station newspaper, *The Carrier*, moved into the north end of the second floor of Wing 2 (Building 2). The exchange operated from Wing 1 until Building 118 was converted into the exchange in 1965. A small exchange remained in Building 2. Personnel offices in the building provided needed services for station residents. Building 2 also provided a variety of services, such as a barber shop for enlisted men, a dry cleaning facility, Education and Training services in Wing 2, an eight-lane bowling alley in Wing 1, and the Navy Wives' Club in Wing 2. In 1971, the Seabees remodeled the bowling alley into a new Reception Center to welcome new arrivals by providing housing referrals and other services to military personnel and their dependents.[4] The Main Navy Exchange Cafeteria, located in Building 2, was remodeled in 1958 and received a new concrete delivery loading dock.

Building 4 contained a gymnasium in Wing 20 when it was first completed. Public Works received approval to convert the old gymnasium into the Enlisted Men's Club in 1948. The $21,000 facility, commonly known as the "White Hat Club" opened on April 22, 1949, offering dancing, games, variety shows, and refreshments to enlisted personnel, their dependents and guests. In 1971, the Seabees completely remodeled the Enlisted Men's Club. The $65,000 project provided more dance floors, another bar, and game room with completely new interior designs. The Enlisted Men's Club appears to have to undergone alteration in subsequent years as well.[5]
In addition to the White Hat Club, Wing 20 of Building 4 provided of services for military personnel, as well as providing permanent housing for marines. In 1957, two Petty Officer Messes, 1st and 2nd Mess Open, were established in the wing; and at one point a portion of Wing 20 served as the Navy Exchange. A recreation center with a large game area for enlisted personnel was completed in 1964 in Wing 16 of Building 4.

The Navy declared NAS Alameda's housing inadequate in 1958, which resulted in many changes in the following decades, including many renovations in the BEQ during the 1960s and 1970s. The quarters in both buildings were extensively remodeled beginning in 1968. This included the installation of dividers to create semi-private living quarters for the enlisted men. One $765,000 project converted six wings into quarters for 492 men. A contract with the Del Webb Corporation resulted in the construction of 182 three-bedroom units and 182 four-bedroom units within the BEQ that was completed in 1969. Renovation within BEQ also included the creation of Enlisted Women's Quarters (EWQ) in Wing 19 of Building 4. The project to alter the living structure within BEQ continued through 1975 as a $2.5 million undertaking to have the facilities meet the Department of the Defense and Navy Bachelor Enlisted Housing Criteria. Maintenance and repairs took place in Buildings 2 and 4 throughout the later decades of the Cold War, including the replacement of windows and doors and fire exits.[6] Aside from these replacements, and the numerous broken windows that currently exist in the buildings, the exterior of the BEQs retain their original structural composition, massing, and design.

Evaluation

Buildings 2 and 4 were built during the initial construction of the station, and they are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[7] The contributing elements of the district, including Buildings 2 and 4, each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[8] These are detailed on the attached sheets, and include smooth concrete surfaces of the buildings, horizontal orientation, flat roofs, emphasizing vertical elements, namely the stairwells in Wings 1 and 20, curved contrasting elements, original and sympathetic two over two windows, three light wooden doors, oval columns along the arcade, quoin-like dividers between windows, Pegasus statues, and incorporated concrete planters and seating areas. Curved features are notable around the entries, windows and in the continuous curving staircases in Wings 1 and 20 **(see Photographs 7 and 13)**. Some of these features, including the quoin-like horizontal striations, are found both on the exterior and interior of the buildings.
In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations

overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[9] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Buildings 2 and 4, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Building 2 and Building 4 do not have significance within the context of the Cold War era, these properties remain contributing elements of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2.Historic/Current name: Bldgs. 2 and 4, Bachelors Enlisted Men Qtrs.
3. Number and street: NAS Alameda Map K,L-21-23 City: Alameda
Zip: 94501 County: Alameda Code: 001
4. UTM Zone: Oakland West, CA,
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION:

6. Property category: District Number of resources documented: 85
7. Existing conditions: these two buildings are nearly identical being 2-story, concrete structures with flat roofs and key-shaped plans. E-W sections, 1200 feet long, have 9 rectangular wings projecting from their outer sides and are introduced by irregular 3-story blocks that face the landscaped quadrange. The 3-story blocks have rounded stair towers set into the ell on one side. The entrance doors of the 3-story blocks are reached by flights of 7 steps with metal railings abutted by curved concrete walls that are connected to the bases of monumental, cast-concrete statues of the winged horse, Pegasus, set against the inner sides of the buildings that the face the quad. The entrance blocks have narrow, vertical, recessed, central panels that have metal-framed windows with 4-light, hopper sash. The long sides of the buildings that face the quad have open arcades with square columns; the arcades are broken at intervals along their length with transverse arches. The upper floors have paired, metal-framed windows with 4-light, hopper sash tied together by scored lines in the adjacent walls that are painted blue in Bldg. 2 and brown in Bldg. 4, in contrast with the white walls. This fenestration is typical of both buildings. The inner sides of the buildings have slightly projecting pavilions at the west ends with recessed entrances raised three steps and flanked by concrete planters. A pattern of six small square windows occurs in the walls on either side of the entrances. The ends of the N-S wings have simple entrances with metal fire escapes leading to the upper floors.

HISTORICAL INFORMATION

14. Construction date: 1940 Original location: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Buildings 2 and 4 contribute importantly to the NAS Alameda historic district under Criterion A because they are the original Bachelor Enlisted Mens Quarters. Constructed in 1940, the two buildings continue to serve their original function and retain a high degree of architectural integrity. Under Criterion B, they exhibit the stylistic traits of the simplified early Modern style in which the buildings constructed from 1940-1945 were designed. In addition, they are embellished with handsome sculpture in the form of two cast-concrete winged horses in a geometric style characteristic of the period. The two buildings form the sides of a court enclosing a landscaped quadrangle.

20. Sources: NAS Alameda records

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

- Horizontal orientation with strong vertical emphasis in the entry pavilion (see Photograph 2).
- Horizontal concrete bands, or quoins.
- Curved planter boxes and concrete barriers at doorways.
- Curved concrete canopies.
- Five-light original doors (See Photograph 11).
- Some original two-over-two double-hung wooden windows and appropriate aluminum double-hung replacement windows.
- Stacked windows and cast-stone ornamentation at entry pavilion (see Photograph 24).

3.3. Character-Defining Elements of Buildings 2, 3, and 4 (also Building 63 and 193)

Buildings 2, 3, and 4 are best considered as a single entity. The buildings are united structurally via a massive arcade, which runs nearly the length of Buildings 2 and 4 and across the front of Building 3. Buildings 65 and 193 are relatively minor appendages to Building 3. This group of buildings arguably includes the best that the NAS Alameda Historic District has to offer. Virtually all character-defining elements found within the Administrative Core generally may be seen on these buildings.

Among the key character-defining elements are:

- Strong horizontal orientation with vertical elements for emphasis. The key vertical elements include the stairwells at the eastern end of Buildings 2 and 4, and the tall columns at the facade of Building 3.
- Quoin-like features.
- Cast stone figures, including the Pegasus figures at Buildings 2 and 4 and the eagle figures at the entrance to Building 3.
- Many original two-over-two double-hung wooden sash on the second story of Building 2.
- Sympathetic aluminum two-over-two double-hung sash in Buildings 2 and 4.
- Steel sash in Building 3.
- Three-light wooden doors.
- Oval columns and long arcade.
- Concrete planters and seating area.

3.4 Character-Defining Elements of Building 16.

Building 16 is a large U-shaped, two-story, flat-roofed concrete building, located immediately east of the Administration Building. It is characteristic of the general horizontal orientation of the buildings in the Administrative Core. More than any other building in the district, however, it typifies the sweeping curved concrete surfaces of the Streamline Moderne style; as noted, it is the most pure example of Streamline Moderne within the historic district. Character-defining elements include:

***P3a. Description (cont.):**

The southwest corner includes the poured concrete dugouts along the south and west sides. The dugouts create an open flat arch with flat extensions on the north and south sides that create additional shade **(Photograph 1)**.

Bleachers were built for the field in 1952 and designated Building 381. The grandstand bleachers have been removed leaving a concrete platform in the southwest corner. Three poured concrete steps and an inset ramp lead up to the concrete bleacher area on the south side and two concrete steps and inset ramp lead to the bleachers on the west side **(Photograph 2)**.

Buildings 424 and 425 are located in the quadrangle between Buildings 2 and 4. Originally constructed as a football field, they were converted to baseball diamonds and given the current building numbers. The baseball diamonds have since been converted to soccer fields and retain no remnants of the previous uses. The quadrangle consists of a large grassy field, surrounded by trees. The fields included moveable soccer goals **(Photograph 3)**.

Originally built in 1945 the Softball Diamond, Building 428, is presently represented solely by its tall chain link backstop. The remnants of the softball diamond are no longer visible and have been replaced by a communal garden maintained by the current residents in the surrounding dwellings **(Photograph 4)**.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

During World War II, as the station developed into its current configuration, baseball and softball fields were scattered throughout the residential and recreational areas of the station. The main field, known as "Boone Field," was located at the east end of Runway 26R north of Hangar 20. When the runway system was reconfigured for jet aircraft the field became a part of the new Runway 7-25. In 1950, the Seabees, short for Navy Construction Battalions, built a new field, Building 422, in an area east of Building 134, which were the former grounds of three softball diamonds. The new 130, 900 square foot field required the removal of Building 183 to complete the outfield. As part of the relocation and expansion, bleachers (Building 381) were constructed in 1952 at a cost of $2000. The bleachers were rebuilt in 1971 as one of the improvement projects carried out by the Seabees under the Self Help program, where Naval groups like the Seabees constructed, maintained and improved Naval facilities instead of hiring contractors. This project continued with the rebuilding of the playing field over the following two years. The upgrades included three softball fields located on station along with the baseball field (Building 422) and were carried

out by the newly formed Building and Grounds Crew.[1] The field has undergone changes in terms of its use and therefore maintenance of grass and infield. It remains unclear when the grandstand bleachers were removed. The current bleachers are a pre-fabricated portable variety.

Building 428 was one of the many softball and baseball fields built on station for the physical well-being of personnel on the base. This particular field was centrally located in the midst of both officer and enlisted housing in the northwest corner of NAS Alameda and completed in 1945. Sometime between 1988 and the early 1990s a community garden was created and absorbed the space set aside for the softball field. Only the chain link backstop remains.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Evaluation

Buildings 424, 425, and 428 were built during World War II operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. Individual buildings or structures constructed during the World War II-era and used during the Cold War are not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These structures are not eligible for listing in the NRHP or CRHR because they do not individually, nor together, possess historic significance under the NRHP or CRHR criteria. The structures do not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era. In the larger context of the naval operations in California and nationwide during this period, the MWR function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support for recreational purposes, and were not

[1] Department of the Navy, Bureau of Yards and Docks, "Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume 12, Districts 12 through 14," Box 38, Record Group 8 P-Books, CEC/Seabee Museum, Port Hueneme; US Navy, *Command History 1972*, Box 2 of 2, 5757-1b, Naval Air Station Command History, 30 Volumes, 1968-1997, RG 181, US Naval Shore Facilities, National Archives and Records Administration, Pacific Region, (San Francisco); US Navy, *History of U.S. Naval Air Station, 1 January 1950 to 30 June 1950, Part II-Documented Narrative*, Command History 4 of 25, 1 July 1949 through 31 December 1950, Box 1 of 2, 5757-1b, Naval Air Station Command histories, 27 Volumes, 1940 to 1992, RG 181, National Archives and Records Administration, Pacific Region, (San Francisco); Department of the Navy, Bureau of Yards and Docks, *Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume 12, Districts 12 through 14*, Box 38, RG 8 P-Books, CEC/Seabee Museum, Port Hueneme; US Navy, C*ommand History 1971*, Box 2 of 2, 5757-1b, Naval Air Station Command History, 30 Volumes, 1968-1997, Record Group 181, US Naval Shore Facilities, National Archives and Records Administration, Pacific Region, (San Francisco); Unlabeled Folder containing 1973 Command History, Box 2 of 2, 5757-1b, Naval Air Station Command History, 30 Volumes, 1968-1997, RG 181, US Naval Shore Facilities, National Archives and Records Administration, Pacific Region, (San Francisco).

historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Playfields like these are typical of military installations. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). As facilities used widely by a large number of people, the structures do not have a direct or important association with a historically significant individual, and are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). None of these facilities are sufficiently significant to be considered contributors to the NAS Alameda Historic District. Furthermore, none retain historic integrity to the district's period of significance.

Individual buildings or structures constructed during Cold War operations on NAS Alameda are not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These structures are not eligible for listing in the NRHP or CRHR because they do not individually, nor together, possess historic significance under the NRHP or CRHR criteria. The structures do not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Playing fields were among the resources built and altered during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of these facilities did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Playfields like these are typical of military installations. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). As facilities used widely by a large number of people, the structures do not have a direct or important association with a historically significant individual, and are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Moreover, Buildings 424, 425, and 428 no longer retain their original use. Buildings 424 and 425 were originally football fields that were converted to softball diamonds. Now they are soccer fields. Building 428 was originally a softball field that has since been converted to a play yard. They do not retain integrity of original design, materials, workmanship or association.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the postwar years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings and structures constructed during the Cold War era, or World War II-era buildings and structures used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Located south of the ship turning basin, the breakwater played a necessary, utilitarian role in fulfilling the station's mission; it protected the carrier piers from shipping and storm damage as well as reduce silting of the channel and turning basin. Yet, this structure did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Despite its relative importance, the breakwater was not constructed until the station was nearly 10 years old. The outbreak of World War II slowed study of the design and construction of the structure. A study, commissioned in 1942 took three years to complete. It determined that the shoreward arm of the breakwater should be constructed +12 feet mllw and the bayward arm at +15 feet mllw to protect the pier from local storm waves and shoaling. Following accepted construction design and methods, Basalt Rock Company constructed a mile-and-a-half (7,920 feet) long rubble mound breakwater of these dimensions. The company aligned the breakwater to enclose the turning basin except for an entrance channel on the west and a 750 foot navigation opening on the south.[1]

In the early 1950s, the breakwater was lengthened from approximately 7,920 feet to its present 8,340 feet. Between 1988 and 1993, the gap between the shoreward and bayward arm of the breakwater was narrowed to its present size.[2]

Many buildings and structures on NAS Alameda, such as the breakwater, fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they

represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[3]

Evaluation

Although contemplated during World War II, Building 200658 was built after the war in the midst of Cold War operations on NAS Alameda, and was part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of the breakwater did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Despite alterations made in the late 1980s and early 1990s, the structure retains some integrity to the period when it was constructed, but it is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The breakwater is purely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It has no direct or important association with a historically significant individual, and is unlikely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 1 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Administration Building

P2 e. Other Locational Data: 950 West Mall Square; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 1 is an E-shaped, two-story, Moderne style building with flat parapet roof measuring 48.946 square feet. It has stucco finished concrete walls and a stout central tower on the façade, which is the main entrance **(Photograph 1)**. The façade tower has three narrow vertical recessed sections, each housing four stacked awning windows with side lights. The recessed entryway with rounded corners has two glazed doors and one-over-four side lights on each side. There are two rows of three, single fixed lights on each side of the entrance and two vertical rows of one-over-four fixed-light windows. Concrete stairs lead up to the entrance and have metal handrails and round concrete planters on each side. The fabric canopy which covered the main entrance in 1992 is no longer there **(Photograph 2)**.

The remainder of the building is characterized by horizontal bands of windows. These are largely two-over-two double-hung windows placed singly and in groups of two, three and four. The horizontal effect created by these rows of windows is reinforced by wall sections between the windows which have been scored into four sections and painted blue to mimic the adjacent windows. Some of the windows are wood frame, while others are aluminum **(Photograph 3)**.

The east wing of the building is set back slightly from the façade and has a similar grouping of windows. Both the north and south entrance to the east wing have short concrete stairways with metal handrails leading to a door with five horizontal stacked lights. Each entrance is covered by a rounded cantilever overhang **(Photographs 4 and 5)**.

On the south end of the central wing is the secondary building entrance. It has a short concrete stairway with metal handrails and a concrete handicap access ramp. These lead up to two personal doors each having five horizontal stacked lights with a vertical row five fixed lights between. The door is sheltered by a rounded cantilevered roof. On each side of this end of the central wing are small single story elements. Another double personnel door is on the east side. It has five horizontal stacked lights and five fixed lights on each side and is covered by a rounded cantilever overhang. Next to it is a metal utility door with louvered vents and a louvered vent transom. An exterior metal stairway leading to the roof is attached to this wing **(Photographs 6 and 7)**.

There are several small bump-out elements in the courtyard between the central wing and west wing. They have shed roofs, metal louvered utility doors and equipment on the roofs. In the northeast corner of the courtyard there is a rounded bump out with a flat roof. The west wing is one story and continues the same design as the rest of the building. The personnel entrance on the south end of the west wing has a short concrete stairway with metal handrails leading up to a door with five horizontal stacked lights and is covered by a rounded cantilever roof **(Photograph 8)**.

Building 1's interior has been modified over the years; however, it appears to retain some original elements. These elements include the design of the building's interior corridors, its terrazzo flooring, interior doors, and curving staircases with metal railing **(Photographs 9-10)**. The interior is characterized by its wide corridors among its three wings. Offices within the building have been modified, yet many of the glazed and wood doors leading to them are likely original. Curved staircases and the three-band metal railing accompanying them reflect the Moderne style of

B10. Significance:

This update form was prepared to provide additional information about Building 1, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 1 began as the Administration Building for NAS Alameda. As part of the original base plan, Building 1 was placed in the prominent position to be seen across the mall from the Main Gate.[1] Johnson, Drake and Piper

[1] Bureau of Yards and Docks, "US Naval Air Station Alameda Administration Building, Barracks, Mess Hall and Galley General Location Plan and Detail Plot Plan,: Yards and Docks #130990, April 1939, not filed, Plans and Maps Room, Alameda City Hall West (Building 1 former NAS Alameda), Alameda, California.

constructed the building in 1940. It retains its original footprint, however internally there have been modifications including office and meeting room renovations conducted in the 1970s and 1990s. Additionally, windows have been replaced from the original wood to aluminum framed, and a canopy that covered the entry and walkway in 1992 has since been removed with the addition of new lettering for the City of Alameda.[2]

Building 1 served as the administrative center of the station with the Commanding Officer (CO), Administrative Department and commanders of other activities at the station. NAS Alameda had 30 commanding officers between 1940 and 1994, most serving for two years. The CO oversaw the operation of the station. As the Navy introduced tenant organizations the CO's influence decreased as activities had independent command structures. The Administrative Department provided general administrative services including mail, central files, directives, messenger service, personnel functions, education and development programs.[3] The department was viewed as the business center of the station, with a primary role in all correspondence and technical data in addition to maintaining its central files. The building also housed offices for the commanding officers of NAS Alameda and outlying air fields, as well as the Public Affairs Office (PAO).[4] The PAO's responsibilities to represent the station to the public included the development of the civilian enterprise newspaper, *The Carrier*, and the annual *Welcome Aboard* booklet for new transfers.[5] Additionally, Fleet Air Headquarters were based on the second floor of the building and the Yard Office, which ran the Security Department, was based in Building 1 beginning in 1940.[6]

Evaluation

Building 1 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[7] The contributing elements of the district, including Building 1, each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District." These are detailed on the attached sheets, and include smooth concrete surfaces of the building, horizontal orientation, flat roofs, emphasizing vertical elements (notably vertical detailing in the entry), curved contrasting elements (including concrete canopies over the entrance), original and sympathetic two over two windows, five light original doors, quoin-like dividers between windows, and incorporated curved concrete

Houses Offices CO of NAS Alameda," *The Carrier*, 16 May 1952.

[7] Sally B. Woodbridge, *Historic Architectural Resources Inventory for the Naval Air Station, Alameda*, prepared for NAS Alameda (1992), 1; Stephen Mikesell, *Guide to Preserving the Character of the Naval Air Station Alameda Historic District*, prepared for Engineering Facility, West, Naval Facilities Engineering Command, San Bruno (1997); Jones & Stokes, *Final Historic Properties Inspection Report for the Naval Air Station, Alameda Historic District, Alameda, California*, prepared for NAVFAC, Southwest and BRAC PMO West (2007), 1-1, 1-2, and 1-3.

planters. Contrasting curved elements are also located on the interior and include the interior curving staircases with metal railings (Photograph 10).

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 1, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1). As no significant events or trends began on NAS Alameda during the Cold War, commanding officers were not associated with significant events, but with daily support operations of the station. In this aspect they are not differentiated from other installation commanding officers. Individual officers may have gone on to make significant contributions to naval activities or had illustrious careers before coming to NAS Alameda, but Building 1 on NAS Alameda is not associated with this productive period of their lives and is therefore not significant under, (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Building 1 does not have significance within the context of the Cold War era, this property remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

City: Alameda **Zip:** 94501 **County:** Alameda **Code:** 001
4. UTM Zone: Oakland West, CA, A B C D
5. Quad Map No.: N3745-W12215/7.5 **Parcel No.:** none

DESCRIPTION

6. Property category: District. Number of documented resources: 85
7. Existing condition: a two-story, concrete building with a flat roof and an E plan. The main facade faces the quadrangle, a major landscaped open space that extends northward to the sentry gate. The entrance wing projects from the facade and has three doors with glazed sections that open onto a flight of concrete steps with three metal railings. A blue cloth canopy extends from the wall above the door. The wall above the entrance has three narrow, recessed sections that are blank at the tops and fenestrated with metal sash. The rest of the building, including the wings, has a blue-painted band of 5 scored lines that ties together the paired, metal framed windows divided into hopper sash with 5 lights. The blue band contrasts effectively with the otherwise white walls. The central rear wing has two stories with one-story blocks on each side; the side rear wings have one story. Entrances to the rear wings are raised on stepped concrete bases with metal railings which incorporate curved planters. Rounded, flat roofs are cantilevered above the recessed entrance doors which have inward curving architraves.

8. Planning agency: WESTNAVFACENGCOM

15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION:

18. Theme: The development of U.S. Navy bases in the San Francisco Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property: District Context formally developed: yes

19. Context: Building 1 is one of the most important contributors to the NAS Alameda Historic District under Criterion A because it was constructed in 1940 as the main administration building for the base. Under Criterion C, the building is representative of the simplified early Modern style in its cubistic form and lack of ornament. The integration of the surface detailing with the basic material of concrete, the treatment of the fenestration as a band around the building, and the design of entrance elements with curves are indentifying marks of the early Modern style.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

- Horizontal orientation with strong vertical emphasis in the entry pavilion (see Photograph 2).
- Horizontal concrete bands, or quoins.
- Curved planter boxes and concrete barriers at doorways.
- Curved concrete canopies.
- Five-light original doors (See Photograph 11).
- Some original two-over-two double-hung wooden windows and appropriate aluminum double-hung replacement windows.
- Stacked windows and cast-stone ornamentation at entry pavilion (see Photograph 24).

3.3. Character-Defining Elements of Buildings 2, 3, and 4 (also Building 63 and 193)

Buildings 2, 3, and 4 are best considered as a single entity. The buildings are united structurally via a massive arcade, which runs nearly the length of Buildings 2 and 4 and across the front of Building 3. Buildings 65 and 193 are relatively minor appendages to Building 3. This group of buildings arguably includes the best that the NAS Alameda Historic District has to offer. Virtually all character-defining elements found within the Administrative Core generally may be seen on these buildings.

Among the key character-defining elements are:

- Strong horizontal orientation with vertical elements for emphasis. The key vertical elements include the stairwells at the eastern end of Buildings 2 and 4, and the tall columns at the facade of Building 3.
- Quoin-like features.
- Cast stone figures, including the Pegasus figures at Buildings 2 and 4 and the eagle figures at the entrance to Building 3.
- Many original two-over-two double-hung wooden sash on the second story of Building 2.
- Sympathetic aluminum two-over-two double-hung sash in Buildings 2 and 4.
- Steel sash in Building 3.
- Three-light wooden doors.
- Oval columns and long arcade.
- Concrete planters and seating area.

3.4 Character-Defining Elements of Building 16.

Building 16 is a large U-shaped, two-story, flat-roofed concrete building, located immediately east of the Administration Building. It is characteristic of the general horizontal orientation of the buildings in the Administrative Core. More than any other building in the district, however, it typifies the sweeping curved concrete surfaces of the Streamline Moderne style; as noted, it is the most pure example of Streamline Moderne within the historic district. Character-defining elements include:

Page 1 **of** 24 ***Resource Name or #** (Assigned by recorder) Building 5

***Recorded by:** C. Brookshear and S. Miltenberger ***Date:** Sept. 30 and Oct. 1, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of Building 5 by Sally B. Woodbridge that was part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached), in which this building was previously identified as a non-contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP). The re-evaluation contained herein concludes that it is eligible for listing in the NRHP as a contributor to the historic district. Its NRHP status code is 3D.

P1. Other Identifier: Assembly & Repair

P2 e. Other Locational Data: 2401 Lexington Street on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Woodbridge provided a general description of this building, but a more detailed analysis is necessary to understand the evolution of Building 5 and its important features. The building encompasses 910,382 square feet and is composed of two rectangular elements with the northern rectangle slightly wider and shorter than the southern. The southern component was constructed in phases between 1941 and 1943. The northern component is known as Building 5A, or the "Interim Overhaul Building," and was constructed in 1945 (See **Diagram**). Each portion was constructed with different materials and techniques, and each will be discussed separately below (**Sketch Map** and **Photograph 1**).

The northern component, Building 5A, can also be divided into two parts: the Interim Overhaul area and the Mezzanine. The Interim Overhaul area includes the majority of this component of the building, with the Mezzanine running along the southern edge. The Interim Overhaul area follows the hangar form found throughout the station, modifying detailing, materials and windows to reflect wartime exigencies. The interior of the Interim Overhaul area is open creating a grand interior space. It is built on a tall concrete foundation and has interior metal framing. A secondary wooden frame connects the exterior sheathing panels to the metal frame. The overall appearance matches the smooth finishes of the other buildings on the station. Front gable roofs clad in rolled composition roofing cover this part of the building. The Interim Overhaul area has three large sliding hangar doors on the north side and one each on the east and west sides (**Photographs 2 and 3**). These hangar doors have full-height side pylons and a shallow shed roof clad in composite shingles between the pylons. The north doors have a pediment above them while the side doors have a flat parapet **(Photograph 4)**. The doors are divided into eight solid panels each, four retracting into each pylon. In the center of each door panel is a rectangular section covered with translucent corrugated fiberglass. The outermost door panels have inset personnel doors. Pairs of personnel doors are set in the southernmost panel of the hangar doors, located on the east and west side of the building. On the north side, the hangar doors are separated by smooth solid wall sections. In the center of each wall is a pair of wide wood personnel doors with nine lights above a solid panel, similar to those found on station shop buildings. Near the hangar doors are single personnel doors of varying types. A small shed roof addition has been placed between the eastern and center hangar doors, just west of center. This addition has stucco walls and a corrugated metal roof. The east and west sides of the addition have pairs of metal personnel doors and louvered vents. On the east and west sides of the Interim Overhaul area between the north corner and the side hangar doors are two story rectangular wings with a central third story along the edge of the building. These wings are part of the building's original construction. The third story is narrower than the lower stories and has large louvered vents along the sides. Exterior metal stairs lead from the southern corner of the wings to ground level at the south end. Irregular groupings of three by five industrial sash windows with textured glass run along the east and west sides of the first and second floors. These windows appear to be late twentieth century replacements. Other window openings appear to have been filled in, and sections of glazing replaced with vent stacks and pipes. In the center of each side is a single recessed door with four lights above a louvered vent. Pairs of solid metal doors are recessed south of center. Each side also has boarded-up or removed doors. The east wing has a small metal stand at a second floor window with a metal rail.

The Mezzanine area is a narrow band between the southern and northern components of Building 5. It is constructed of smooth concrete with a flat roof with parapet. A portion of the Mezzanine is tucked behind the pylon associated with the east and west side doors of the Interim Overhaul area. Both the east and west ends of the Mezzanine have four evenly spaced windows. The windows on the east end are one-over-one metal frame and the rest are three-by-

four light industrial sash windows. The main personnel entrance for Building 5 is located on the east end of the Mezzanine (**Photographs 5** and **6**). There are traces of two cantilevered roofs over the entrance remaining, but the entry is no longer protected. Double glass doors with a transom are located in the northern and southern portion of the east wall. The west side of the Mezzanine has a pair of metal doors. Between the Mezzanine and the southern half of Building 5 is a narrow enclosed corridor just over one story tall. This corridor has overhead doors at each end.

The southern part of Building 5 is composed of several sections. In the northwest corner is a wooden section constructed in 1943, known as the Northwest Extension. The southwest corner was constructed in 1941 and is labeled Door 12 on the west and Door 11 on the south. The northeast corner was constructed in 1943 and is known as the Northeast Extension. The southeast corner was constructed in 1942 and includes Door 5 and the wooden shop area. The remaining portion of the building, consisting of two hangar type sliding doors (Door 10 and Entrance Zone 2) and two wall sections on the south, and the centrally located hangar type sliding door on the east (Door 7), are a part of the building's original construction in 1940. Only the west end of the Northwest Extension is visible (**Photograph 7**). It is clad in horizontal flush mounted wood to create a smooth surface. Two rows of windows run along the façade. The upper row of windows is five sets of 16, 20, and 16 light industrial sash windows. The lower level has five groupings of 28, 35, and 28 light industrial sash windows. All of these appear to be replacement sash and glazing set in wooden openings. A door with external metal fire escape interrupts the northern grouping of windows on the second floor. A personnel door interrupts the first floor windows north of center. The flat roof has four metal trapezoidal clerestories running north-south. These have both industrial windows and translucent corrugated panels on the east and west sides.

The southwest addition built in 1941 has a hangar type sliding door on the west labeled Door 12, a second hangar type sliding door on the south labeled Door 11, and a windowed shop area between Door 11 and the original portion of the building. The southwest addition is constructed on a concrete foundation with stucco siding. The southwest corner of the addition, including Door 11, has standard hangar construction (**Photograph 8**). The flat roof has a rectangular gable roof clerestory in the center. The south side of Door 11 has identical flanking pylons as on other parts of the building with a shallow awning roof above the door and false pediment with decorative band. The door is made up of eight panels. Each door panel has 20 sets of 16 light windows above a solid bottom. A pair of tall doors is set in one of the center door panels; the other center door panel has a single personnel door. On the west side are two rows of industrial sash windows. The lower row is interrupted by two pairs of personnel doors with concrete surrounds. Because the section that connects this hangar construction with the original construction on the east is lower, the upper row of windows is visible on the east side. Door 12 on the west side is north of the hangar construction (**Photograph 9**). It includes a shorter hangar type sliding door without side pylons. The eight door panels have two 9 light and two 15 light windows. One personnel door is set into one of the door panels. Above the hangar door are lights set into the wall and covered glass domes. The roof is flat with a parapet and sawtooth clerestories.

The building's original section has two hangar type sliding doors on the south with separating wall sections **(Photograph 10)**. A third sliding hangar door is located on the east side and labeled Door 7. This element of Building 5 has a concrete foundation and is clad in smooth stucco. The two south side hangar doors have a false pediment, decorative band above the hangar doors and shallow shed roof over the doors. In the center of each roof section is a gable roof rectangular clerestory. The hangar doors are made up of eight panels, each panel containing 12 light windows. Some of the windows in the eastern hangar door have been replaced with louvered vents. A pair of tall metal doors with a suspended flat corrugated roof is installed right of center on the two hangar doors. Two additional small personnel doors are set into the door panels to the left. Between the two hangar doors is a wall panel which has been rebuilt since the removal of a southern 1943 addition **(Photograph 11)**. This wall section has smooth tilt up panels with a ribbon of 9 and 12 light windows high on the wall and two large overhead doors with inset personnel doors. East of the eastern hangar door (Entrance Zone 2) is a second wall section clad in stucco with a large section of 9 and 12 light windows set into the wall. The windows on the east half have been replaced by horizontal grooved fiberglass sheets and a large overhead door. An external metal stair that accesses three levels is centrally located on the wall section. The ground level doors are tall and have an overhead hoist rail above them.

Centrally located on the east side of the building is Door 7, the only part of the original construction visible on that side (**Photograph 12**). Door 7 is a short hangar type sliding door composed of six door panels and flanked by pylons. The door track is protected by a shallow shed roof clad in seamed metal and topped by a false pediment. The hangar door panels each have a row of two 9 light windows sets on each side of a 12 light window. On the lower portion of the door the panels are solid and the upper windows have been painted. Small personnel doors are cut into the door panels. Topping this element of Building 5 is a flat roof with two large sawtooth clerestories. A small portion of the north wall of the original building adjoining the Mezzanine is visible to the east. It consists of two rows of industrial windows running the length of the building. The upper row is four lights high and the lower row is seven lights high. Stucco bands run above, below and between the ribbons of windows. The northern side has a parapeted flat roof with sawtooth clerestories.

The Northeast Extension is north of Door 7 and it is clad in flush horizontal wood siding creating a smooth finish (**Photograph 13**). Two rows of industrial windows run across the north and east sides. The upper windows are four lights high and the lower windows are 7 lights. Unlike the north side of this element of the building, the eastern windows are grouped with narrow intervening wall space. A large overhead door is in place of some of the lower level windows on the east side. An exterior metal stair is centrally located and leads to a second level metal door. In the northeast corner is a three level tower with no fenestration with a two part overhead door located on the east side; a pair of personnel doors is just to the south of the overhead door. The roof of this element of the building is flat with a square gable roofed clerestory in the center and surrounding parapet.

The Southeast Extension fills the final corner of the original building and extends past the southern wall. This extension is clad in horizontal flush boards to continue the building's smooth surface (**Photograph 14**). The northern portion of the extension is slightly taller than the southern portion. The first floor along the south end is constructed of concrete. Windows are irregularly spaced on two levels. The northern portion has replacement industrial sash windows and the southern portion has replacement metal frame sliding windows. Equipment is mounted outside the east wall further disrupting the elevation. There is a large overhead door and two sliding doors at ground level. An exterior metal stair leads to a pair of recessed doors on the second level. Along the south end replacement industrial sash windows are placed in the first level and sliding windows on the second level. Remnants of plywood awnings are visible on these upper windows. Another exterior stair provides access to a door on the second level. A pair of tall personnel doors is centrally located at ground level. Two additional pairs are located on the west side.

B10. Significance:

This update form was prepared to provide additional information about Building 5, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country during the mid to late 1930s. While construction was authorized in 1937, the station was incorporated into the Hepburn Board's 1938 recommendations to establish six major naval air stations across the country. NAS Alameda, along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program. The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings, however, plans were altered and adapted for local conditions. As a result, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report. [2]

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period planners located industrial facilities like Assembly & Repair (A&R), piers, seaplane functions, landplane services, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The placement of Building 5, housing a key function of the station, near both sea and landplane hangars, storage, and other shops expresses the functionality of the station plan. In addition to the careful master planning for the station following principles of organization, functionality, hierarchy, and efficiency, the Navy also designed prominent buildings on the station in a manner that corresponded with the efforts to create a modern and organized facility. This was achieved by adhering the station's plan to a Beaux Arts formal spatial layout and by

B.L. Allbrandt, "History of the Naval Air Station and Naval Aviation Depot at Alameda, California" (May 1996), 2, available online at: Aerospace Maintenance Duty Officers' Association, http://www.amdo/history.html (accessed September 2009); United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 229; H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70.

designing most of its prominent buildings in the Moderne style, which blended neo-classical proportion, symmetry, and order with modern design concepts of the time.[3] The planning and architecture on NAS Alameda demonstrate trends which BuDocks designers drew upon related to campus planning, modernistic design, and the continued traditional architectural expressions of federal buildings during this period. Architects worldwide began to abandon historical revival styles during the late 1920s and especially during the 1930s in favor of designs that consciously illustrated modernity and technological progress using simplified geometric forms and ornamentation. Often buildings designed in the new style(s) of the period, including Art Deco, Moderne and International Style, retained proportion, symmetry, and order found in buildings inspired by Classical architecture, but without direct allusion to historical styles. Materials such as concrete, metals, and glass block – all of which were used on NAS Alameda – were prominently used to illustrate a directness regarding building fabric to help portray the machine / technological-inspired aesthetic. The rapid evolution of aviation and other forms of transportation during the 1920s and 1930s particularly inspired designers to illustrate in architecture and industrial design modern society's departure from the past that was seemed apparent, or was being sought, at the time. The expansion of civilian and military aviation was symbolic of modern technological achievement and streamline forms appeared in and influenced the design of seaplane and landplane aircraft as well as in the buildings of the growing nationwide network of civilian airports.[4]

Important to the master planning was consideration of future expansion, which led some areas to be left undefined in initial plans for station, and buffer zones for expansion to be left around key buildings like Building 5.[5] Many of the original buildings were constructed in increments, with planned expansions shown on early station plans. The original A&R facility (Building 5) was planned for incremental construction, and then expanded beyond the original plans.[6]

The Navy constructed Building 5, the Assembly and Repair Shop, in phases between 1940 and 1945 (see **Diagram** and **Photographs 15-18**). Construction began on the southern half in 1940 as part of the original station plan. The following year an extension was made on the southwest side, followed by a southeast extension in 1942, and extensions to the northwest and northeast of the southern half in 1943. The northern half of Building 5, known as Building 5A or the Interim Overhaul Building, was constructed in 1945 (**Photograph 12**). Much of the original structure was steel framed, yet many of the wartime additions were wood framed.[7] The northern half, Building 5A,

[3] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

incorporated a light wall enclosure structure, referred to as "Thermax," which reduced the size of foundation needed for the large building.[8]

Diagram: Showing the development of Building 5 and 5A. Construction dates for each section is given.

Between 1940 and 1945, the period of significance for Building 5/5A, the building grew to its current size. See Table 1. In 1940 the original building consisted of a rectangle with central extended entry on the east side. This portion is visible as Entry Zone 1, Door 10 and Door 7 **(Photograph 15)**. These three doors were constructed with the same types of hangar doors found on the station's hangars. Entrance Zone 2 and Door 10 led to large hangar-like spaces,

including the high ceilings and open space spanned with truss systems. These areas mimicked the other hangars on base built following standardized hangar plans. [9]

From the beginning, planners anticipated additions to this building to the west and the Navy designed the first in 1940 (**Photograph 16**), using the same methods of the original 1940 building.[10] Located to the west of the original building it included another hangar like area (Door 11) and surrounding shops. The observable difference from the 1940 construction was a taller hangar bay.

The next four additions occurred in quick succession between 1942 and 1943 (**Photograph 17**). Located in the southeast corner, the first of these additions was an addition to the metal shop. Unlike the previous additions this one did not use hangar construction techniques. The area was divided into several smaller shop areas, and was renovated in 1977. In 1943 the Navy made three additions to Building 5. The south addition, now removed, had hangar-like construction and provided cleaning for aircraft arriving for service. At the height of the war building materials were limited and the northwest (north of Door 12) and northeast (Extension) extensions lacked the architectural and material sophistication of the earlier portions of the building. These areas were constructed of wood and had roof heights and skylights that do not follow the pattern established in the rest of the building. While former exterior walls separated these areas from other areas the additions themselves had few interior walls.[11]

Continued growth in naval aviation required a near doubling of the space in 1945 and construction of the Interim Engine Overhaul Building, Building 5A, on the north of the building (**Photograph 18**). This addition included Doors 13-16 and Door 5-5A a, the Mezzanine, and single story shop space on the east and west sides. This cohesively planned addition used hangar doors and large truss systems to create a characteristic open floor plan capable of a variety of uses. Between the new open area and the previous construction was the mezzanine containing offices and small shop spaces.[12]

Photograph 18: Building 5 and 5A (labeled as #1 on original photo reference), September 1, 1945.[16]

Throughout the war, one of the station's essential missions was to repair and maintain aircraft. The Assembly & Repair (A&R) Department experienced the most growth of any station department during the war. Organized to assemble planes which arrived from manufacturers in parts, and repair damaged planes, the department became organizationally more complex, dividing into nine divisions (Aircraft Overhaul, Engine Overhaul, Accessories, Metal and Machines, Radio-Radar, Engineering, Planning, Maintenance, and Personnel) located in Building 5 and in several adjacent buildings.

Building 5 began as the Assembly and Repair Shop that had a variety of responsibilities, including assembly, emergency repair, machine shops, modification areas, small and large surface shops, and paint shops in addition to many smaller services.[17] Building 5 would receive aircraft in need of repair or regular maintenance in which the body of the aircraft would be pulled into the main hangar and disassembled for cleaning and repair in the smaller shops located within Building 5.[18] For example, the Metal-Machine Division originally comprised the east side of the building, in which they manufactured, repaired and fabricated various parts, fittings, and equipment required for aircraft assembly and more.[19] Repaired aircraft and, early in the war, aircraft arriving from manufacturers would be reassembled and sent into action. Over the four years of American involvement in the war, department personnel assembled, modified, overhauled, and shipped more than 24,000 aircraft, an average of approximately seventeen per day. A&R's work included not only aircraft assembly and repair, but also life raft and parachute repair, and custom manufacturing of parts. Naval personnel and station employees tested new materials and processes, including welding

Plexiglas, and pioneered new techniques, such as aircraft preservation.[20] The demands of World War II resulted in the numerous additions to the original building between 1940 and 1945 and which are seen today. The Interim Overhaul Building (Building 5A) doubled the workspace for the Assembly and Repair Department and established new divisions for ordnance in addition to expanding the assembly floor.[21] The lists of services, in addition to aircraft maintenance, included overhauling power plant components, repairing and manufacture rubber and plastic parts, calibrating measuring devices, and fabricating metal parts.[22]

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain.[23] As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible.[24] O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy.[25] This additional change did not affect the activities carried out in Building 5. NARF became the Naval Aviation Depot in 1987 and by 1992 the Naval Aviation Depot was the largest tenant on the station as well as the fifth largest employer in Alameda County and continued to carry out the same mission. This location became the sole site for repairs to T56 and TF34 aircraft in the nation.[26]

Changing methodologies for aircraft overhaul, and increasing sophistication in aeronautics required new types of shops and facilities within Building 5. Most of the building had open floor space; therefore many changes in usage were accomplished by relocation of equipment and not by building modifications. The number of interior walls is small compared to the overall footprint and the interior modifications to them had little impact on the building's overall integrity, particularly as expressed on the exterior of the building. Interior modifications included the remodeling of the lobby space into space for the Industrial Medical Division, which was expanded in May 1957, the addition of a "semi-clean" room for the overhaul of gyro rotors, and the Standards Laboratory for calibrating measuring devices.[27] Changes to the interior also included installation of a "curtain of air" that had limited success in preventing fumes from the building's paint facility wafting into the office area. During the late 1960s the NARF supervisors association and managers association sponsored improvements to the east side entry that included installation of a flagpole and trees in planters that lined a walkway. There was a plaque noting who donated the trees.

[27] History of Naval Air Station Alameda, 1 January 1951-30 June 1951, Part II- Documented Narrative, Command History 1 of 25, 1 November 1940, Box 1 of 2, 5757.1b, NAS Command Histories, 27 Volumes 1940 to 1992, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco); History of U.S. Naval Air Station, Alameda, Report Symbol (OPNAV 5750-5), 1 November 1940 to 31 December 1958, Command History 6 of 25, Box 1 of 2, 5757-1b, Naval Air Station Command Histories, 27 Volumes, 1940-1992, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco); "'Semi-Clean' Rom at NAS Defies Dust," 7/6/1968, Clipping File IV, Naval Air Station Jan.1968-July 28, 1970, Alameda Free Library, Alameda, California.

The flagpole, trees, and plaque have been removed (**Photograph 19**).[28] Other exterior modifications include partial reroofing of Building 5 in 1956 and the installation of corrugated plastic windows in 1963.[29] The southern extension, formerly used as a cleaning shop, was removed in late 1993 or early 1994 (**Photograph 20**). The cleaning shop had been used to strip aircraft parts of paint before those parts were placed in tanks filled with acids and other cleaners. This wing of Building 5 was demolished following completion of Building 25 on Taxiway-H, which was designated as the paint stripping shop, thus the cleaning shop at Building 5 was not longer needed. In addition, the cleaning shop required chemical clean up, which was conducted with the removal of the building.[30] Otherwise the Building 5 retains the footprint established with the addition of the Interim Overhaul Building in 1945.[31] When the building was last inventoried for naval real estate accounting in 2008, it was noted to retain distinct areas for various shops including corrosion control, metal and non-metal components shops, hydraulic components, pneumatic oxygen, weapons overhaul, ground equipment rework, and calibration, in addition to the large aircraft reworking area and the administration area located on the second floor.[32]

Evaluation

In terms of Building 5's place within the existing NAS Alameda Historic District, this evaluation concludes that it is a contributing resource because of its shared association with other contributors to that district's significance under Criterion A and under Criterion C, as discussed below.

The original district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[35]

The buildings considered non-contributors were those within the district that were either built outside the period of significance (i.e., post 1945) or those built within the period of significance that had lost integrity through alteration. Building 5 was placed in the latter category because the phased design between 1941 and 1945 was misidentified as being the result of "multiple alterations and additions from the 1950s-1970s which infilled the spaces between the hangars and attached structures of different sizes to the existing buildings."[36] Woodbridge had limited access to files held by the Facilities Management Office. These files included limited alteration dates and little to no information regarding the nature of the alterations. Research undertaken for this project in building plans, contracts, and other sources show that the changes during the 1950s – 1970s were largely confined to interior alterations, with relatively few exterior changes to this massive, complex structure. Historic photographs and building plans show that the principal building segments, and large facades featuring large hangar doors and industrial design, were built during the historic district's period of significance and retain historic integrity to that period.

Building 5 is a contributor to the NAS Alameda Historic District, which is significant at the state level under NRHP Criterion A and NRHP Criterion C. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development during the period of significance 1938-1945. Building 5 is significant for its association with the historic district's importance in naval air station development and the role NAS Alameda served during World War II. In addition to its historical significance, Building 5 also retains sufficient historic integrity to convey its significance to the historic district's period of significance.

Under Criterion A, Building 5 is a contributor to the NAS Alameda Historic District because of its important role within the station as the primary facility to assemble and repair aircraft and its association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the station's role in Pacific theater naval operations during World War II. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the

[35] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," 1992, 1-2, 11-12.
[36] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," 1992, 12.

only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. Building 5 crucial function and its successive expansions during the war illustrate and provide a direct link to NAS Alameda support of its central and vital role in the Pacific theater.

Under Criterion C, Building 5 is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation. Design and construction of Building 5, as a large assembly and repair facility, demonstrates the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period, and it shows the magnitude the Navy placed on the design to illustrate the modernity and importance of the naval aviation strategy for the Pacific Fleet. Refined details of the hangar-like design, architectural details in keeping with the station theme, and functional location further support the importance placed on the design. Building 5 shares character-defining features (discussed further below) with the hangars and shops on NAS Alameda. Completion of the station plan was sped up and successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional design of Building 5 enabled the station to rapidly expand to serve and support this important wartime activity.

The historic district, and its contributors including Building 5, does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

Building 5 is significant as a contributor to the historic district and it retains sufficient historic integrity to convey that significance. It has the physical features that relate to its significance, and it retains elements of all aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

Building 5 shares character-defining elements with hangar and shop facilities throughout NAS Alameda, as defined in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[37] These elements include smooth surfaces above a tall concrete base, prominent pylon-like door pockets, integrated into the structure, and rooftop clerestory monitors. The hangar doors are original to the building and a key feature. Divided into segments these are largely glazed across the upper portions, on the southern half of the building, and present a solid appearance on the northern half of the building (Building 5A). Other character-defining windows are the bands of steel industrial sash windows found throughout the building. The building incorporates few decorative items, but the copper horizontal banding and shed roofing above hangar doors, especially on the southern half of the building, are

[37] Stephen Mikesell, *Guide to Preserving the Character of the Naval Air Station Alameda Historic District*, prepared for Engineering Facility, West, Naval Facilities Engineering Command, San Bruno (1997).

***Recorded by:** C. Brookshear and S. Miltenberger ***Date:** Sept. 30 and Oct. 1, 2009 ☐ **Continuation** ☒ **Update**

subtle character-defining features. Together these features visually connect this building to others within the historic district with similar character-defining features. No interior character-defining features were identified for Building 5.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of former NAS Alameda, had direct or important associations with historically significant Cold War-era themes. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. Building 5 did not play an important role in the technological advancements that were historically significant during the Cold War, nor did it play a historically significant role in naval operations overseas; rather, Building 5, like NAS Alameda in general, performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[38] Building 5, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or a historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). It played a valuable role in the operations of the station, but while it served this function on NAS Alameda during the Cold War era and serviced technologically sophisticated aircraft and weapons systems – it did not play a significant role in their research, design, testing and evaluation, functions that might have imbued it with significance.

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. &2. Historic/Current name: Building 5, Metal Treatment facility.
3. Street: Avenue F, NAS Alameda. Map N-21 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: an assemblage of concrete buildings of varying heights and dimensions approximately 9302 ft. on the long side by 780 ft. wide by 63 ft. at the highest elevation. The complex includes several hangars; two on the S side retain their original features of sliding metal-framed doors with multiple glazed sections that rise to just below the roof parapet. Massive rectangular corner piers enframe the front elevation. Parapets conceal curved roofs supported by steel trusses. The N elevation is composed of the fronts of hangars which have sliding metal doors of a later design; the spaces between the hangars have been infilled with blank walls. The W elevation is a chaotic collection of utilitarian buildings of various sizes with different kinds of metal-sash windows. The E elevation is similarly composed and includes hangars of recent construction.

4. HANGARS AREA

4.1. Architectural Vocabulary of Buildings in the Hangars Area

The Hangars Area is of obvious historical importance to the NAS Alameda, which operated as an air station for more than half a century. The hangars are also among the most imposing structures within the historic district, with each building looming large and the rows of hangars creating dramatic vistas. **Photograph 35** shows the vista created by Buildings 77, 39, 40, and 41. **Photograph 36** shows the equally dramatic vista from the hangars to San Francisco Bay. The Hangars Area includes Buildings 20, 21, 22, 23, 39, 40, 41, and 77. The area exists on two sides of the historic district, facing First Street to the east and Avenue F to the north.

Although it is the most imposing area from the structural standpoint, it is a much less complex area from the design review standpoint because the buildings are nearly all the same. The seven hangars -- Buildings 20, 21, 22, 23, 39, 40, and 41 -- are essentially identical. Building 77, the passenger terminal is unique.

4.2. Surface Materials, Basic Building Forms

The seven hangars are large, steel framed buildings, surfaced in thick stucco with tall concrete foundations, or bulkheads. At the two ends of each building, the "walls" are taken up almost entirely by the hangar doors, along with the pockets for those doors at either side. These large pockets are like pylons in their sculptural form. On the side elevations, the door pocket pylons flank a two-story band of office and shop space. The hangar buildings include shed-roofed light monitors on the rooftop. The basic shape of the end wall is shown in Photograph 34; the shape of the side office wing is shown in **Photograph 37**.

Although massive, the seven hangars are rather simple buildings, from the structural as well as the architectural standpoint. In terms of the basic structure, the character-defining elements include:

- Smooth stucco surface above a tall concrete bulkhead.
- Prominent pylon-like door pockets, integrated into the structure (these door pockets are often freestanding).
- Rooftop monitors.
- Grand interior hangar spaces with office wings to either side.

The design review considerations for the basic form of the hangars include the following:

- Respecting the exterior appearance while providing maximum flexibility in the re-use of the hangar spaces. It is nearly inevitable that the huge hangar spaces will need to be subdivided for re-use. In terms of the visual contribution of these buildings, the subdivision of those interior spaces should have little or no effect on the historic district as a whole.
- Respect for the exterior appearance includes discouraging construction of additions.

Building 77 is in the Hangars Area but is a much different building type. Because it was a gateway building -- a building frequented by the visiting public -- Building 77 was treated architecturally as if it were part of the Administrative Core. The front of the building -- the elevation meant for public enjoyment -- faces the taxiway. At this elevation, Building 77 is a very Moderne structure, with curved surfaces leading to the central entry, as shown in **Photograph 38.** The entry includes a wide concrete stairway. The rear (north elevation) of the building faces the Shops Area and is much more utilitarian in design. The rear and side elevations are shown in **Photograph 39**.

Character-defining elements of Building 77 include:

- Smooth concrete surface.
- curving entry composition.
- Wide ceremonial entry stairs.

As discussed in the introduction, Building 77 was modified to include third story wings and single-pane, picture windows at the facade. This type of addition and window modification is instructive with respect to the types of modifications that should be discouraged under the design review process. The addition, one of few in the historic district, matches the curvature of the original but introduces a new material (plywood) which is not consistent with the reinforced concrete design of this building and of the historic district generally.

4.3. Windows and Doors

The key doors at the hangars are the massive hangar doors at either end. These doors, typical of aircraft repair hangar doors from the period, appear to be entirely original and also operational. These doors should be regarded as the most important elements of the seven hangars and largely irreplaceable.

Smaller windows and doors are found on the side office wings, behind the hangar door pockets. The two-story office wings include two wide bands of steel industrial sash. The steel industrial sash generally includes 16 panes in each panel, four of which open in an awning manner. In nearly all cases, the original steel industrial sash appear to be in place and operational. **Photograph 40** shows the steel industrial sash on the second story of the east side of Building 20. Building 20 is currently in use. It will be observed that many of the windows shown in that photograph have been opened, indicating the windows are operable. Retaining operational windows is a key consideration in maintaining historic buildings in an area with the climate of Alameda Island, in which windows may be opened virtually year around.

The side office wings of the hangars also include many original steel personnel doors, two of which are illustrated in **Photograph 41**. The original steel doors included steel transoms. In

many instances, these transoms have been blocked off or otherwise modified, as shown in this photograph. While minor in relation to the scale of the building, this type of modification should be discouraged during the design review process.

Building 77, although a much different type of building, includes windows and doors that are typical of the Hangars Area, including awning-type steel industrial sash. These windows are set in elegant bands at the facade, as shown in Photographs 1 and 36. Building 77 also includes steel personnel doors, similar to those used in the hangars. The windows at the facade of this building have been modified, as discussed.

The character-defining windows and doors in the Hangar Area include:
- Immense glazed segmental hangar doors.
- Steel industrial sash with awning-type openings.
- Steel personnel doors with transoms.

Design review considerations for these windows and doors include:

- The hangar doors should be regarded as irreplaceable. These should be repaired rather than replaced.
- The hangar doors should be retained, even if they must be fixed in place.
- The steel industrial sash is very difficult to replace because few companies still manufacture it. Barring emergencies, this very durable window material should be repaired rather than replaced.
- If it must be replaced, this sash should be replaced in kind. The complex window patterns and industrial appearance cannot be replicated with fixed "picture window" type sash. The clumsy effect of this type of window can be seen in Photograph 1.

The good news from a design review standpoint is that it is demonstrably possible for the hangar buildings to be re-used without damage to the character-defining windows and doors. Building 20 was being re-used at the time this report was prepared. The side windows and doors were being used as intended, as were the hangar doors, which provide convenient access to industrial areas. The "soft" elements of these buildings are apparently quite durable and have been maintained well. The office windows, for example, all appear to be operational and are being used.

4.4. Features and Elements

The character of the buildings in the Hangars Area is defined by the strictly utilitarian approach to their design. There are few features or elements that were added to these buildings strictly for the sake of architectural embellishment. The buildings were built for heavy use and are largely devoid of applied decorative elements.

Nonetheless, some of the utilitarian elements of the buildings are noteworthy. A surprising aspect of the buildings was the extensive use of copper flashing. This copper, now aged to its

natural green patina, exists on the pent roof over the hangar doors and on the parapet of the door pockets and on the sides of the office wings. This copper is almost completely intact. In a few instances, however, the copper roofing over the hangar doors has been replaced or covered with a composition shingle roofing material, which detracts from the appearance of the building. This is true, for example, with the pent roof over the hangar doors of Building 41.

In addition, the hangar buildings include a decorative band on the door pockets and across the face of the hangar door ends, defining the bottom of the pent roof over the hangar doors.

In summary, the character -defining features and elements are few but include:

- Copper flashing and roofing.
- Decorative band at the fascia of hangar door pockets and above hangar doors.

Design review considerations are relatively few as well:

- The copper flashing is a very durable material and expensive to replace. It should be repaired rather than replaced, unless shown to be beyond repair. If replaced, it should be in copper in the geometry of the original.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 9 ***Resource Name or #** (Assigned by recorder) Building 6

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 8, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Public Works Transportation Shop Garage / Firehouse

P2 e. Other Locational Data: 950 West Ranger Avenue on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 6 is a one and two-story concrete building with an irregular U-shaped plan with parapet flat roofs enclosing 39,580 square feet. The north wing forms the base of the U and east and west wings extend southwards. The exterior of the building has a protruding water table. Five scored horizontal bands above that correspond to the tiers of the window sash; however, the two-story central section of the north wing lacks this detail **(Photograph 1)**.

The north wing has a two story central section. Fenestration on the north wing first floor includes seven groups of three-part fixed metal windows composed of a five-over-five window flanked by a pair of five-over-three windows (two of which have inset six light personnel doors), and four vehicular doors composed of a four-part five-over-three fixed window over a solid metal apron **(Photograph 1 and 2)**. The clipped corner at the east end has a pair of five-over-four fixed metal windows and a six light metal personnel door with concrete canopy in the southwest corner. The clipped corner at the west end has a five-over-three window with ducting in the top row. The centrally located two-story section on the north wing fenestration includes three sets of horizontal two-over-three fixed pane metal windows on the second floor, with a decorative concrete relief panels between them (Photograph 3). To the west of the second story section is a one-story flat roof clerestory addition with six pairs of two-over-three fixed metal windows and an exterior metal ladder leading to the second-story roof.

Fenestration on the west wing includes nine bays comprised of three solid corrugated metal overhead doors, two matching the window and metal apron style doors on the north wing, and four two-part overhead vehicular doors composed of six three-over-three windows over six two-over-three windows with a solid metal apron. Two of these doors have inset personnel doors **(Photograph 4)**.

The south side of the building opens up to an I-shaped courtyard. The south end of the west wing has a shed roof with two sets of three-over-five fixed pane windows flanking a four-over-five window **(Photograph 5, far left side)**. The west and east wings both have one-story and two-story projecting building into the courtyard area at the south ends of the wings, creating an L-shape. The west side L has four corrugated metal overhead doors and the east L has two corrugated metal overhead doors, a chain link fenced bay, and a two-part fixed pane and metal apron overhead vehicular door with inset personnel door **(Photograph 6)**.

A pair of three-part windows composed of five-over-four fixed pane metal windows are located on the west and east walls of the projecting structures facing each other **(Photograph 7)**.

Fenestration on the south side of the north wing includes four window groups of three-over-five fixed pane windows (three with metal personnel door or metal panel additions), a two-part overhead vehicular door, a fixed pane and metal apron style vehicular door, an open bay lacking a door, and a two pairs of five-over-two fixed windows **(Photograph 6)**. The central second story fenestration includes two, three-part, six-light, horizontal windows on the west side. The clerestory addition has six pairs of two-over-three fixed metal windows.

B10. Significance:

This update form was prepared to provide additional information about Building 6, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Peter Sartoria of San Francisco built Building 6 in 1940 during the initial development of NAS Alameda. The U-shaped building was originally constructed as one structure with two building numbers (Building 6 on the east and 7 on the west) and became solely Building 6 in 1960. Public Works shops and the transportation office occupied the area known as Building 6, while Building 7 was the garage and station firehouse. The garage was originally designed to accommodate 60 vehicles, but was already too small for the base's needs by 1944. The garage also had two parts storage rooms. The Public Works transportation department was in charge of maintenance and repair of all the

[1] Both Photographs 8 and 9 are details of aerial views included in: "History of Assembly and Repair Dept," RG 181, 3195B-C, Box 1 of 22, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).

"rolling stock" from trucks and cars, to cranes and other heavy equipment. Transportation detail, which was the movement men, materials, and supplies, was also a function that the department carried out within the building.[2]

Additions to the south ends of the east and west wings were added between 1941 and 1942 (**see Photographs 9 and 10**). In 1942 there was an extension to the sleeping quarters of the firehouse that was constructed by Johnson, Drake and Piper in the centrally located second story. Between 1944 and 1945 a shed roof was added off the south wall of the west wing and a flat roof addition at the northeast corner.[3] The east side of building originally had only three bays, with the original driveways visible on in the 1944 aerial view (**Photograph 10**), however, the middle bay is now filled in. Three bays on north side have been replaced with windows (**see Photographs 1 and 2**).

Evaluation

Building 6 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district, including Building 6, each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[5] These are detailed on the attached sheets, and include smooth concrete surfaces, flat roof, horizontal orientation, remaining steel vehicular doors, steel sash windows, and incised concrete band between windows. While not listed in the 1997 "Guide," relief decoration like that between the second floor windows is recognized in other areas of the station and should be considered a character-defining feature. Although some original interior elements may remain, the building has undergone many interior renovations and none of the interior elements are considered character-defining.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the

Cold War period. Building 6, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Building 6 does not have significance within the context of the Cold War era, this property remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

1. & 2. Historic/Current name: Fire Station, Building 6
3. Street: Ave. D btwn. Second & Third Sts. **NAS Alameda Map** N-24
City: Alameda, 94501 County: Alameda Code: 001
4. UTM zone: Oakland West, CA
5. Quad map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION
6. Property category: District Number of documented resources: 85
7. Existing condition: a one- and two-story concrete building with parapeted, flat roofs and an irregular U plan. The central, two-story section of the building on Avenue D has 3 large metal doors for the fire trucks. The doors have 12 lights above a metal apron; the wings have doors and windows with metal mullions and metal 20-light sash. Between the windows and around the corners of the building wings the walls are scored with lines that correspond to the tiers of the window sash. The building has no other decorative detail. The buildings was altered in 1986, but the alterations have not destroyed its architectural integrity.

NAS ALAMEDA Building 6

HISTORIC INFORMATION

14. Construction date: 1940 Original location: yes
15. Alterations: Exterior alterations to openings and additions to rear in 1986.
Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases for World War II in the S.F. Bay Area Area: Naval Air Station, Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: The Fire Station, Building 6, contributes to the NAS Alameda Historic District under Criterion A because it was built in 1940 in the early period of mobilization for World War II. Under Criterion C, the building is significant because it is a permanent class structure in concrete and retains a high degree of integrity despite minor alterations carried out in 1986. Stylistically, the building exemplifies the simplified, early Modern style in its cubistic form and absence of decorative detail with the exception of lines scored on the walls that tie the openings together.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Building 7 is a two-story 15,547 square foot material engineering laboratory. The building has a flat roof with high parapet. The parapet has openings on the northern side at roof level. The concrete sides are divided into decorative panels. The concrete building has three bays on the east and west sides and five bays on the north and south sides. The main entrance is located on the south side. It is recessed in the eastern most bay and includes a pair of glass doors. The center three bays on the south side have fixed windows. The east and west bays have solid panels in place of windows. The panels have a decorative impression of vertical boards. A secondary entrance is located on the west side, in the center bay. (See Continuation Sheet.)

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***P3a. Description (cont.):**

Fixed windows are located in the southern two bays on the first and second floors; the northern bay contains a solid decorative panel. The north side has fixed windows in the center three panels of the second floor. The first floor has two pairs of delivery doors in the western panel, one panel of windows and solid panels for the final two bays. The east side has high horizontal windows in the center bay of the second floor. The lower level has solid decorative panels. A solid metal emergency door is located in the southern panel of the east side. Single story metal equipment surrounds are located on the north, west and east sides.

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 7 is a late Cold War addition to the NAS Alameda facility. Ralph Larsen and Son Incorporated of Burlingame constructed Building 7, which opened in February of 1986 as the Naval Materials Engineering Laboratory, the first part of a $46 million dollar modernization program on base. The laboratory had been housed in a Quonset hut since 1967 and its new home in the $2.9 million dollar building was the first new addition to the base in fourteen years. Operations within the building included a fuel testing laboratory, an inorganic laboratory, an oil analysis laboratory, an X-ray laboratory, a physical testing laboratory, and a non-destructive testing (NDT) laboratory.[1] Research conducted included plane crash investigations, development of guidelines for metal use and preservation, and re-engineering of paint application that to produce paint that would possibly deflect radar detection. The laboratory also provided technical support for Navy forces around the world, including reservists and crews in training, working largely with parts and products that were produced by the Naval Air Rework Facility (NARF) on station.[2]

Evaluation

The history of the station during the Cold War illustrates that neither the district, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played a key role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities

around the nation.[3] Building 7, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (Criterion A / CRHR Criterion 1), nor an historically significant individual of that era (Criterion B / CRHR Criterion 2), nor does it exemplify an important type, period, or method of construction of the Cold War Era (NRHP Criterion C / CRHR Criterion 3). The building is not likely to reveal important historical information (NRHP Criterion D / CRHR Criterion 4).

Furthermore, while Building 7 served a valuable function within the NAS Alameda facility during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). While it retains integrity to when it was originally built, the building is not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 7 does not possess historic significance and is not a contributing element of the NAS Alameda Historic District.[4]

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 7, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 8 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: General Storehouse

P2 e. Other Locational Data: East of Saratoga Street, between West Ranger and Avenue E; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The building remains generally as Woodbridge described in 1992, with three corrections and general clarifications. The 288,881 square feet rectangular building has four towers, not six. Three are evenly spaced along the northern façade and the fourth is centrally located on the southern façade **(Photograph 1)**. The window bands have been repainted an ochre color and the windows are a repeating series of twelve and twenty light hopper windows. The canopy along the northern and southern sides is cast concrete constructed as a part of the building **(Photograph 2)**. The canopy is flat across the top, but curves from the wall to the underside of the canopy **(Photograph 3)**. Below the canopy is a raised loading dock with stairs on the east and west ends. Each tower has a two part overhead door in a recess with curving sides. The fenestration and doorway pattern along the north side consists of four sets of windows flanked by overhead doors and a pair of windows, this pattern is located between the towers. The overheads on either side of the west tower on the north side have been replaced, one with a set of windows containing a personnel door and the other filled with two windows. The south side is similar, although lacking two of the towers. The south side has five overhead doors along the side along with window sets. A shed roof walkway leading to a skywalk to Building 9 has been added above the shed roof above the loading dock. The main personnel door is located centrally on the west end. The entry consists of a pair of wood doors with four lights and transom recessed into rounded frames. A rectangular flat concrete roof is cantilevered over the concrete entry stoop. The concrete stairs have metal tubular rails.

The interior of Building 8 contains large open spaces with "mushroom" shaped, concrete pier supports **(Photograph 4)**. Portions of the interior have been modified for office use and much of the large spaces contain contemporary conveyor machinery **(Photograph 5)**. Some of the interior doors and shelving, as well as the skylights, are likely original elements, but they do not reflect stylistic characteristics of this otherwise slightly Moderne-styled building. There are no interior character-defining features within Building 8.

B10. Significance:

This update form was prepared to provide additional information about Building 8, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

K. E. Parker of San Francisco constructed Building 8 in 1940 as a general storehouse to support A&R operations, with later additions in 1942 and 1943.[2] Contractor Johnson, Drake and Piper made the 1942 addition with an extension of the east end.[3] Use of the building included Supply Department general storage, as well as additional parachute storage overflow from Building 5.[4] The 72-member staff of the Accounting Department moved to the southwest corner of second floor of the building in 1944 and was divided into four sections: Time, Cost, Stores, and Report and Bookkeeping. Adjoining the main office was the "Machine Room," of the Time Department that housed the "International Business Machines" (IBM), addressographs, and other mechanical devises for making checks, statistics for personnel reports, cost distribution, individual records of earnings, daily time cards, and accumulation of earning statements.[5]

In 1949 the Machine Records Office was moved with the Accounting Office into an area that was converted from storage space, where all tabulating machines and personnel could be centralized. The space also housed a mechanized stock control system for the Supply and Fiscal Department.[6] The Accounting Department was later renamed the

Comptroller Department, the mission of which was to provide management data to the commanding officer, provide budget guidance, provide financial plan analysis, maintain an internal review program, time keeping, and payroll for NAS Alameda and its tenants.[7]

The Data Processing Center, which occupied the area previously used as covered storage, was located on the first floor of Building 8 in the 1960s, and broken into three departments: Administration and Planning, Operations, and System Design and Programming. The center housed computer equipment for processing information for NARF, the Supply and Financial Programs, and other base operations.[8] In the late 1960s the Communications Department operated the Automatic Digital Network (AUTODIN) Mode I Division branch out of in rooms 147, 159, and 160 in Building 8. The mission of the Communications Department was to provide rapid communication services to meet the requirements of the station. The Communication Department expanded in the early 1970s an installed a Naval Telecommunications Center, to consolidate the Message Center in Building 1, with the Data Communications Terminal already in Building 8. The center provided all message processing, external routing, reproduction, delivery, and pick up of all narrative and data card traffic to and from the station for all tenant commands and Fleet units at the Station. The center was also provided a communication guard responsible for communication center functions for ships berthed at the station.[9]

By the early 1990s, the Navy Regional Data Automation Center (NARDAC), San Francisco, was located on the second floor of Building 8. NARDAC San Francisco was a full-scale information processing center with regional and Navy-wide responsibilities for non-tactical data processing services and technical support for computer systems.[10]

Evaluation

Building 8 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[11] The contributing elements of the district, including Building 8, each retain

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 7, 2009 ☐ **Continuation** ☒ **Update**

adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the

Naval Air Station Alameda Historic District."[12] These are detailed on the attached sheets, and include smooth concrete surfaces, flat roof, horizontal orientation, vertical accents (the towers), steel industrial sash windows, original steel personnel doors, curved walls flanking entries, canopy over main door, and canopy with curving support along loading dock. Although some original interior elements remain, such as the "mushroom" shaped concrete piers, interior doors, and skylights, none of them are character-defining.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[13] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 8, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 1). Building 8 was utilized in the Cold War era for storage, supplies, and data processing as a support function of the station and not associated with Cold War-era themes. The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Building 8 does not have significance within the context of the Cold War era, this property remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 8, Multi-purpose Administration
3. Street: Third St. and Ave. D **NAS Alameda Map** N-25 CITY: Alameda
Zip: 94501 County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a 4-story, concrete building, 500 ft. long, 180 ft. wide, and 39 ft. high, with a flat, parapeted roof above which project 6 stair towers, and a rectangular plan. Typical fenestration consists of metal-framed, paired and tripled windows with 9 lights and hopper sash. The fenestration is visually tied together with a band of scored concrete painted blue in contrast with the white walls. Metal doors are set in the ground floor of the stair towers in large metal-framed openings. The stair towers are fenestrated with long vertical strips of metal-framed openings. Metal canopies above the ground floor extend for most of the length of the building's long sides.

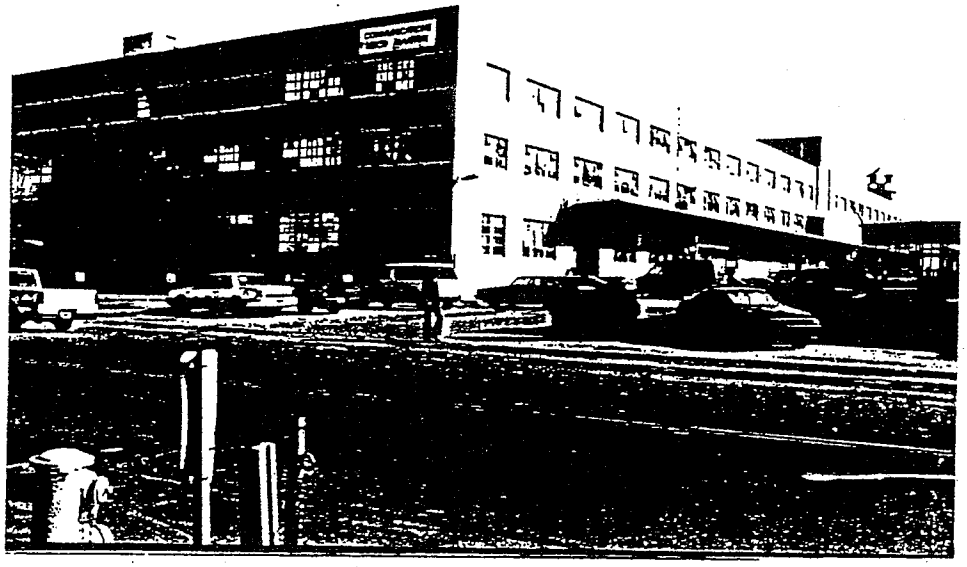
NAS ALAMEDA Building 8



HISTORICAL INFORMATION

14. Construction date: 1940. Original use: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: Development of U.S. Navy bases in the S.F. Bay Area for World War II Area: NAS Alameda Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Building 8 contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1940 as part of the original core of permanent buildings on the base. Under Criterion C, it is representative of the simplified early Modern style in which the buildings on the base were designed. It is also very like one of the building types constructed at the Naval Supply Center in Oakland in the same year.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

CONTINUATION SHEET **Trinomial**

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 9
***Recorded by:** C. Brookshear and H. Miller ***Date:** October 8, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 9 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Aircraft Storehouse

P2 e. Other Locational Data: 707 West Tower Avenue on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The south side of this 118,714 square foot building remains essentially as Woodbridge described in 1992. Six pairs of large sliding metal framed doors with six, nine-light windows are distributed evenly along the side. Inset in the western half of each pair is a smaller personnel door. One pair of large doors has a suspended metal roof halfway up protecting the approach to the doorway. The east end is arranged like the south with a single pair of large doors. The windows to the north are disrupted by a regular sized overhead door with concrete surround. The west end of the building is arranged like a hangar. Four hangar door panels slide into pilasters on either side. The top of the doors are protected by a shallow awning roof. A horizontal decorative band runs across the elevation above the door. The door panels are solid across the bottom and have 12, 12-light windows each. The parapet forms a slight pediment between the pilasters. The end is grounded with a raised watertable. The north side has a wood framed shed roof addition open on the north side. The sides are clad with horizontal wood and the roof is plywood with composite roll. Square wood support posts divide the shed into 28 bays along the side. These are interrupted by a metal skywalk from Building 8. Under the shed roof addition the northern side of the building appears to be similar to that of the southern.

The interior of Building 9 does not appear to contain any of the original mechanical supply system associated with the building originally. The interior of Building 9 was not accessible, available views of the interior showed only contemporary shelving in the former aircraft storehouse. Therefore, there are no apparent interior character-defining features remaining in Building 9.

B10. Significance:

This update form was prepared to provide additional information about Building 9, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

K.E. Parker of San Francisco constructed Building 9 in 1940 under a 1938 lump sum contract awarded to twenty-five companies for the first phase of base construction.[2] This aircraft storehouse was constructed as a permanent building and was completed in two phases. The first phase of construction was the west half of the building and the later addition was built by Johnson, Drake and Piper **(Photograph 6)**.[3] An open-sided series of equipment shelters with a lean-to roof running the length of the north side of the building was added between 1943 and 1946.[4] In the 1970s the building was also used as a general warehouse.[5]

Evaluation

Building 9 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[6] Under Criteria A and C, Building 9 was eligible as a aircraft storehouse and

its connections to the A&R mission of NAS Alameda during World War II and was also part of the 1939 base design of NAS Alameda within the shops area. The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[7] These are detailed on the attached sheets, and include smooth stucco siding above a tall concrete base, hangar like form, hangar-like doors, and steel industrial sash windows. There are no interior character-defining features.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 9, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). Building 9 continued to function in the Cold War period as an aircraft and general storehouse as a part of the A&R support operations on the station. The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not possess Cold War-era significance, Building 9 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 10 ***Resource Name or #** (Assigned by recorder) Building 10 and 34

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 8, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building in "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992 by Sally B. Woodbridge (see attached). The re-evaluation contained herein concludes that Building 10 is eligible for listing in the NRHP as a contributing element of the NAS Alameda Historic District. Its NRHP status code is 3D.

P1. Other Identifier: Power Plant

P2 e. Other Locational Data: 2221 Lexington Street on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 10 remains largely as described in the previous evaluation, however, some clarification is needed regarding its construction history. The eastern most and western most ends were completed in 1945, five years after the original main building was constructed (**Photograph 1**) resulting in a 21,341 square foot building. Both phases are board formed concrete and the eastern end has exterior vertical buttressing on its north and south sides. About midway along the north side is a raised, exterior loading dock with a steel beam hoist and pairs of sliding utility doors (**Photograph 2**). On one side of the dock is a recessed metal personnel door and on the other is a small square addition with pairs of sliding windows and two metal personnel doors. Another change noted from the previous evaluation is the removal of tanks from the southern side of the building leaving only the concrete tank cradles. There is also a pair of steam whistles on a metal scaffold structure on the roof at the east end of the building. Adjacent to the north (rear) elevation of the west end is a 90 x 32 foot open-air electrical transformer known as Building 34 (**Photograph 2**).

B10. Significance:

This update form was prepared to provide additional information about the Power Plant, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

As military tension around the world increased during the 1930s, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur J. Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. The assertive conclusion of the Hepburn Report in 1938 was that the need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning. NAS Alameda was one

of six major naval air stations that the Hepburn Board recommended for construction, and one of three that were entirely new. [1]

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[2] Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. However, local conditions necessitated alterations for improved functionality at given locations.[3]

The NAS Alameda station plan had a comprehensive aesthetic design based on the Beaux Art planning used in City Beautiful planning popular in the first half of the twentieth century. The movement borrowed planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, which were employed on NAS Alameda. Various *partis* or shapes, such as buildings and courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical spatial relationships.[4] Early plans for NAS Alameda show a station arranged along intersecting axes and divided into functional areas, although without details that would emerge during the station's early years. In the early plans from 1939 the north-south axis ran from the main gate bisecting the mall and the Administration Building (Building 1). The Powerhouse (Building 10) was bisected by this axis by October 1939. Additional construction during World War II led to an evolution of the east west axis, but the north south axis remained as originally planned. The location of the Powerhouse on the north south axis illustrates its functional importance as it is centrally located amid the shops and hangars which drew most of its power. The initial

footprint at this location was for a building that was situated symmetrically along the north south axis. Base planning for naval air stations emphasized orderly organization of functions, which would support placing the power plant in a very central location on the facility.[5]

In addition to the careful master planning for the station following principles of organization, functionality, hierarchy, and efficiency, the Navy also designed prominent buildings on the station in a manner that corresponded with the efforts to create a modern and organized facility. This was achieved by adhering the station's plan to a Beaux Arts formal spatial layout and by designing most of its prominent buildings in the Moderne style, which blended neo-classical proportion, symmetry, and order with modern design concepts of the time.[6] The planning and architecture on NAS Alameda demonstrate trends which BuDocks designers drew upon related to campus planning, modernistic design, and the continued traditional architectural expressions of federal buildings during this period.

Architects worldwide began to abandon historical revival styles during the late 1920s and especially during the 1930s in favor of designs that consciously illustrated modernity and technological progress using simplified geometric forms and ornamentation. Often buildings designed in the new style(s) of the period, including Art Deco, Moderne and International, retained proportion, symmetry, and order found in buildings inspired by Classical architecture, but without direct allusion to historical styles. Materials such as concrete, metals, and glass block – all of which were used on NAS Alameda – were prominently used to illustrate a directness regarding building fabric to help portray the machine / technological-inspired aesthetic. The rapid evolution of aviation and other forms of transportation during the 1920s and 1930s particularly inspired designers to illustrate in architecture and industrial design modern society's departure from the past that was seemed apparent, or was being sought, at the time. The expansion of civilian and military aviation was symbolic of modern technological achievement and streamline forms appeared in and influenced the design of seaplane and landplane aircraft as well as in the buildings of the growing nationwide network of civilian airports.[7] Secondary buildings on the station utilized a simplified version of the style which focused on the unornamented form, proportion, and order. These buildings, like Building 10, relied upon their form and material to mesh with the prescribed station architecture.

It was within this plan of strategic station construction utilizing a functional and aesthetic design that the Powerhouse (Building 10) was constructed. The first phase of the Powerhouse was completed in 1940 by contractor K. E. Parker of San Francisco. It is likely that the Navy anticipated eventual expansion of Building 10 upon future increases in power demands. The stress on naval aviation during World War II transformed NAS Alameda dramatically, requiring the new station to adapt to increased demands and expand its capabilities, which required increasing electrical power supply. Shop facilities and housing saw the greatest growth. These facilities served the 23 ships, 22 air squadrons and 1,500 aircraft homeported at the station and serving in the Pacific Theater. The rapid expansion of station facilities and activities strained the electrical system. Between 1941 and 1944, two 1901 model steam engines were placed cab to cab on a siding adjacent to the power plant and were used as generators. To accommodate station

Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122.

[6] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

Bush, *The Streamline Decade*, (New York: George Braziller, 1975), 26-42 ; Gerrie Schipske, *Early Aviation in Long Beach*, (Charleston, SC: Arcadia Publisher, 2009); Allastair Gordon, *Naked Airport: A Cultural History of the World's Most Revolutionary Structure*, (Chicago: University of Chicago Press, 2008); Geza Szurvoy, *The American Airport*, (St. Paul, MN: MBI Publishing Co, 2003), 70, 82, and 90-95.

growth during World War II Building 10 was doubled to its present size with additions off the east and west sides in 1944-1945 and the steam engines retained as a standby source of power (**Photographs 4-6**).

Following World War II, station development stabilized and alterations to Building 10 were largely focused on changes to internal equipment. Modest exterior changes include the infill of some windows and addition of exterior lighting as well as piping that runs along and into the facility. In the early 1970s the plant boiler was converted so that it could run on natural gas, as well as diesel and heavy fuel oils, and historic photographs indicate that the smoke stack at the north side of the building was removed at about the same time. Large tanks that once sat at the southeast end of the building have been removed (**Photograph 1**).[8]

Building 34 was constructed as transformer station Number 1 at the northwest corner of Building 10 in 1941.[9] It appears to have been regularly altered and upgraded over the years since its construction.

Evaluation

Like the other contributors to the historic district, Building 10 has an association with the district's significance under Criterion A, for its contribution to the nation's defense during World War II, and under Criterion C, for its style and architectural importance. The original district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[11]

The buildings considered to be non-contributors were those within the district that were either built outside the period of significance (i.e., post 1945), or those within the period of significance that had lost integrity through alteration. Building 10 was placed in the latter category because, according to Woodbridge "…the original building has lost integrity through alterations which occurred outside of the historic period."[12] No specific alterations were mentioned. Woodbridge had limited access to files held by the Facilities Management Office. These files included limited alteration dates and little to no information regarding the nature of the alterations. Research undertaken for this project in building plans and aerial photographs indicates, however, that the expansion of the building occurred within the period of significance between 1944 and 1945, with relatively few exterior changes to the building since that time. A review of all additional available records did not show major alterations were made after the period of significance as indicated by Woodbridge. Historic photographs and building records show the additions under construction in January 1945 (**Photograph 5**), were completed by September the same year (**Photograph 6**). The building retains sufficient historic integrity to the historic district's period of significance and alterations made after the period of significance do not affect the character-defining features of Building 10 as a whole. Building 10 is a contributor to the NAS Alameda Historic District, which is significant at the state level under NRHP Criterion A and NRHP Criterion C. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development during the period of significance 1938-1945. Building 10 is significant for its association with the historic district's importance in naval air station development and the role NAS Alameda served during World War II. In addition to its historical significance, Building 10 also retains sufficient historic integrity to convey its significance to the historic district's period of significance.

Under Criterion A, Building 10 is a contributor to the NAS Alameda Historic District because of its important role within the station as the primary power plant and its association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the station's role in Pacific theater naval operations during World War II. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the

[12] Woodbridge, "Historic Architectural Resources Inventory," inventory form for Building 10.

*Recorded by: C. Brookshear and H. Miller *Date: October 8, 2009 ☐ Continuation ☒ Update

West Coast that was completely new construction. The Navy's detailed attention to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. Building 10's crucial function and its successive expansions during the war illustrate and provide a direct link to NAS Alameda support of its central and vital role in the Pacific theater.

Under Criterion C, Building 10 is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation.

Design and construction of Building 10, as a centrally located unadorned power plant, demonstrates the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period, and it shows the magnitude the Navy placed on the design to illustrate the modernity and importance of the naval aviation strategy for the Pacific Fleet. While the building lacks the adornment of some prominent buildings on the station, this building's plan, fenestration, and materials complement the buildings constructed as part of the station's initial development and expansion. Also, its central location and symmetrical footprint along the station's north south axis demonstrates its importance within NAS Alameda's orthogonal layout and design. Building 10's prominent location on the north south axis helps define the overall composition of the station. Its mass and general architectural character is also complimentary of the adjacent industrial buildings. Completion of the station plan was sped up and then successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional design of Building 10 enabled the station to rapidly expand to serve and support this important wartime activity.

The historic district, and its contributors including Building 10, does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

Building 10 is significant as a contributor to the historic district and it retains sufficient historic integrity to convey that significance. It has the physical features that relate to its significance, and it retains elements of all aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

Like other public works and shops buildings discussed in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," the buildings' main character-defining feature is the concrete building material

CONTINUATION SHEET **Trinomial**

Page 10 **of** 10 ***Resource Name or #** (Assigned by recorder) Building 10 and 34

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 8, 2009 ☐ **Continuation** ☒ **Update**

with exterior vertical buttresses.[13] The other character-defining features are the stacked industrial windows forming vertical window openings. No interior character-defining features were identified for Building 10.

Building 34 is a utilitarian infrastructural element that does not have similar direct or important associations with the World War II context of the district, nor does it appear to retain integrity. Building 34 does not meet the criteria for listing in the NRHP or CRHR, and is a non-contributing element of the historic district.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[14] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure at NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Neither Building 10 or Building 34, therefore, meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Building 10 does not individually possess Cold War-era significance, this building meets the criteria for listing on the NRHP as a contributing element of the NAS Alameda Historic District (NRHP Status Code 3D).

19

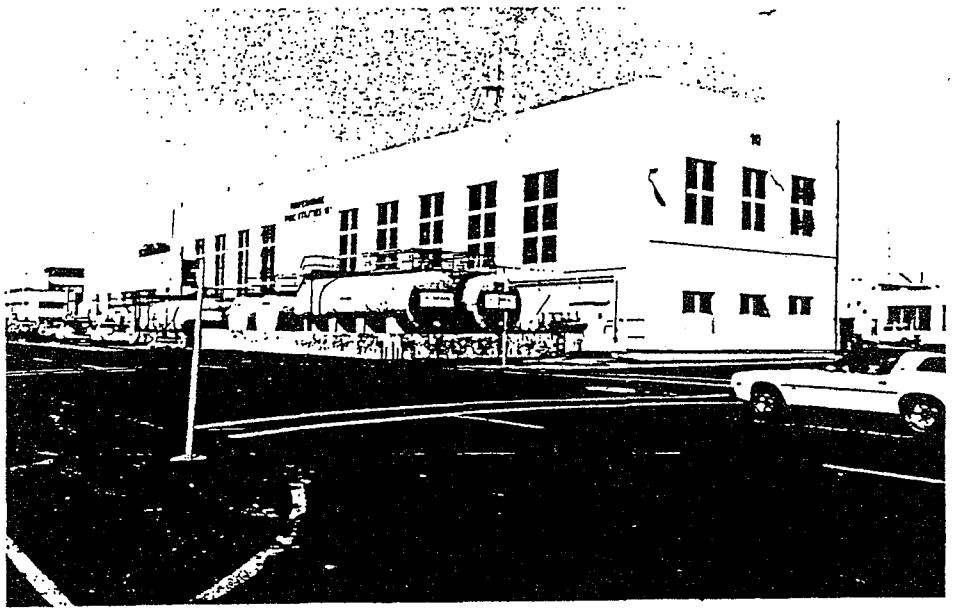
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 10, Engine lab and Powerhouse.
3. Street: Ave. F **NAS Alameda Map** O-24 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a two-story, concrete building with a flat roof and a rectangular plan. The building is fenestrated with metal-framed, multiple-sash windows grouped vertically in four and six sections; the ground floor has small, paired, metal-framed windows. The entrance door is set in a metal frame. A series of large, metal storage drums are mounted in concrete bases on the S side of the building.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none



HISTORICAL INFORMATION

14. Construction dates: 1942, 1943, and 1947 Original location: Yes
15. Alterations: Original 1942 structure was doubled in size in 1943; a third addition occurred in 1947. The present structure thus lacks integrity during the historic period.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945. Property type: District Context formally developed: yes

19. Context: Building 10 does not contribute to the NAS Alameda Historic District because the original building has lost integrity through alterations which occurred outside of the historic period.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990
24. Survey type: visual inspection
25. Survey name: Section 110(A)(2)
26. Year form prepared: 1990 By: Sally B. Woodbridge Organization: none
Address: 2273 Vine St., Berkeley, CA 94709 Phone: (415) 848-4356

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

State of California — The Resources Agency **Primary #** P-01-011142

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 13
***Recorded by:** M. Bunse and R. Flores ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 13 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Paint-Oil Storage

P2 e. Other Locational Data: 2100 Ferry Point on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 13 is a single-story 34,540 square foot building with a rectangular footprint. The majority of the building is comprised of two components of roughly equal size built at different times. The northern portion, built in 1941 and 1953, is poured concrete with a flat roof. The middle portion, built in 1942, is a wooden frame rectangle with horizontal wood siding and double bow truss roof **(Photograph 1)**. Attached on the south end is a poured concrete extension with no openings **(Photograph 2)**.

The northern part of the building has poured concrete exterior loading docks on both the east and west sides. Opening onto the docks are evenly spaced, metal roll-up overhead doors, three on each side. The west side also has a fourth loading dock flush to the wall with hinged doors. Personnel entrances are comprised of two metal doors opening onto the loading docks on the west side, and a third accessed by a concrete stairway with metal pipe railing. On the east side are four metal personnel doors: two inset in the roll-up doors; one opening onto the loading dock, but raised above its surface; and another, a double door at the end a the loading dock accessed by a concrete staircase and ramp. Fenestration includes metal three-by-four industrial sash windows. The 1941 and 1953 constructions are indistinguishable.

The middle part of the building's pair of bow-truss roofs have two wooden vent cupolas on top them and there is a low parapet on the south end. Fenestration on this part of the building consists of eight-over-eight, wooden, single-hung window sets. Near the roofline on the south end are two sets of five metal frame windows. On the east and west sides are at-grade metal roll-up overhead doors, one with an inset personnel door. Also on the west side raised loading dock flush with the wall accessed by a metal roll-up door. Next to it is a single personnel door accessed by a wooden stairway with a plain wood balustrade and sheltered by a corrugated metal awning roof supported by wood posts. The concrete addition on the south end has no windows or doors.

B10. Significance:

This update form was prepared to provide additional information about Building 13, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the station's original design axial and formal layout. In 1941 the Navy had constructed the initial portion of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98) along with the shipping warehouse (Building 105, since demolished). The original construction of Building 13 took place in three phases between 1941 and 1945 under contract with Johnson, Drake and Piper.[4] The concrete structure at the north end of the building was built in 1941. The reinforced concrete structure at the south end of the building was originally open along the north side and was constructed in 1941. The wood frame construction between both concrete buildings was constructed in 1942 as a lumber stockade (Building 59) and was later incorporated as part of Building 13.[5] A one-story building at the northern end of the block was removed at to accommodate a 1953 concrete addition at the northern most end of the building for the Air Navigation Office, and is nearly indistinguishable from the 1941 construction.[6]

The Navy constructed Building 13 for paint and oil storage in an area of the base relatively isolated from other activities.[7] In the early 1960s Aircraft Maintenance Support Equipment Branch moved from Hangar 40 into Building 13. In the late 1960s all aviation ground support equipment shops moved from Building 13 to Building 41.[8] A portion of the building remained hazardous and flammable materials storage throughout the Navy's tenure.

Evaluation

Building 13 was constructed between 1941 and 1942 with an addition in 1953. Although construction of the Building 13 was part of the original period of construction on the station and falls within the period of significance for the NAS Alameda Historic District, the building lacks architectural significance and integrity of design, setting, and feeling and does not convey an association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity and utilitarian building style prevents Building 13 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[9]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 13 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and that included considerable post-1945 construction. These factors prevented the area from conveying the appearance of the station during the period of significance (1938-1945).[10] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, paint / oil storage (Building 13), and engine test cells. Research undertaken for this project in building plans, station maps, and aerial photographs indicates that this area was not a part of the original formal station plan and that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[11] Expansion in this area did begin during World War II but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. In addition, Building 13 itself lacks integrity of design, materials and workmanship because of the 1953 addition.

The history of the station during the Cold War illustrates that Building 13, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None

of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[12] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 13, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 13 performed standard storage functions and housed maintenance activities found throughout the Navy.

Building 13 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

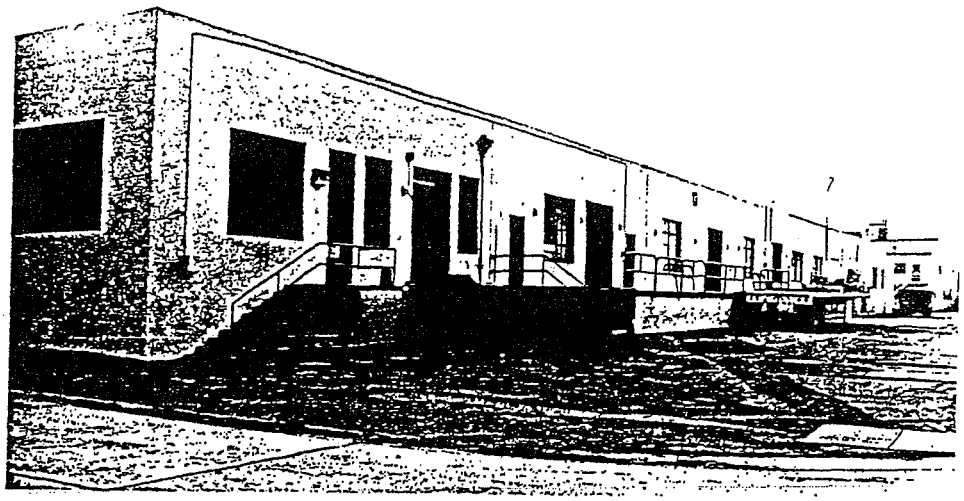
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.& 2. Historic/Current name: Building 13, Storage for paint and oil
3. Street: Fifth St. **NAS Alameda Map** P-28 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W11215/7.5

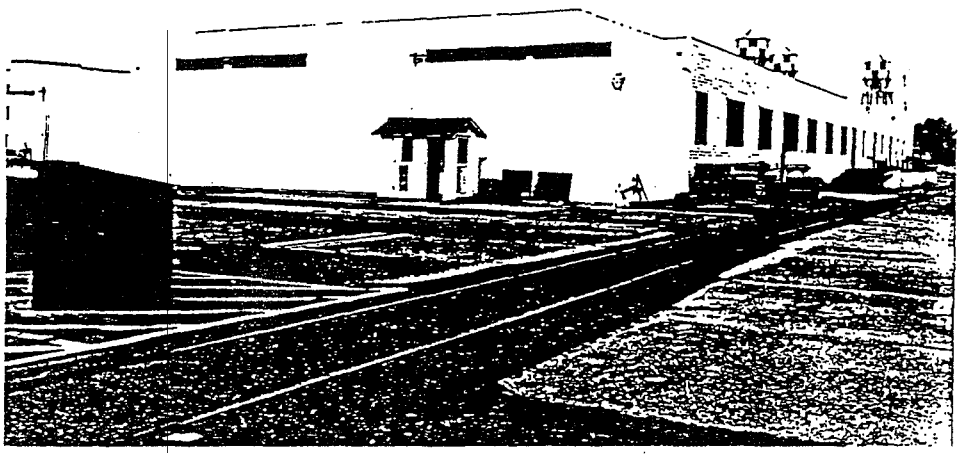
DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a one-story, concrete building,100 ft. long, with a wooden addition at the S end. The roof is flat; a loading dock extends along the E side. Doors are both wood with glazed sections and solid metal and wood; typically they are reached by flight of concrete steps with metal railings. Typical windows are single and double with metal-frames and hopper sash with multiple lights.

8. **Planning agency:** WESNAVFACENGCOM
9. **Owner:** US Government
10. **Type of ownership:** public
11. **Present use:** military base
12. **Zoning:** none
13. **Threats:** none



NAS ALAMEDA Building 13



HISTORICAL INFORMATION

14. Construction date: 1942 Origional location: yes
15. Alterations: wood section added to the S end ca. 1950.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District. Context formally
developed: yes

19. Context: Building 13 does not contribute to the NAS Alameda Historic District because of an addition ca. 1950, which has resulted in a loss of integrity.The building also stands in a part of the base that has changed and no longer conveys the impression of the period of significance.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990
24. Survey type: visual inspection
25. Survey name: Section 110 (A)(2)
26. Year form prepared: 1990 By: Sally B. Woodbridge Organization: none

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Engine Test Cell

P2 e. Other Locational Data: 1800 Ferry Point on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The engine test cell building was completed in stages between 1941 and 1943, and then modified substantially in late 1945 and 1948, with additional changes occurring over the subsequent years. The building now encompasses 61,753 square feet. The test cells consist of twelve reinforced concrete test cells facing the southern side of the building, with a rectangular wood frame shop across most of the north side. The engine test cells are connected by a one story reinforced concrete corridor crane way that runs through the center of the building, along the blast doors on the north side of each cell, and just south of the preservation shop. Each cell has a flat roof. Test Cells 1 through 10 make up the main portion of the building and are numbered west to east. Test Cells 11 and 12 are taller and wider, and separated by a one story small shop area and are slightly larger than the other test cells. Each of the test cells has a square intake tower on the north and an exhaust tower on the south. The intakes for Test Cells 3 and 4 are taller than the others in the first group of ten, and have vents which look like multi-light industrial sash windows. Cells 1 through 5 have exhaust towers which angle out and have concrete post corner supports **(Photograph 1)**. Test Cells 6 through 10 are constructed similarly to the others, but lack the angled wall section, rather, the wall is perpendicular and accessed through single and paired metal personnel doors. Between each cell at the mezzanine level are control rooms that do not extend the full length of the test cells. Small concrete shops are located at each end of Cells 1 through 10. The west and south side of the eastern shop has a row of windows with built up header and sill. The west side has four pairs of three-by-five metal sash windows with partial awning operation, and the south side has four, three-by-four metal sash windows with partial awning operation. A personnel door with four lights and ramp is located at the southwest corner. The western shop has an overhead door which has been enclosed with corrugated fiberglass and plywood.

The wooden shop area has a gabled parapet roof supported by wood trusses with three side gable clerestory roof vents. The shop is clad in horizontal wood boards **(Photograph 2)**. Fenestration is composed of groupings of two-by-four light and three-by-four light wooden windows with partial awning operation. The east end has two rows containing two groups of four windows: three-by-four on the upper level and two-by-four on the lower level. The north side has a variety of groupings including four groups of nine, four-by-three windows; stacked vertical pairs of four-by-three windows and paired columns of four-by-three windows. The eastern grouping of windows is interrupted by a sliding wood door. Near the center of the north side is a filled-in, tall utility door and operating sliding utility door. Above these doors is a structure made of protruding wooden beams which appears to have been used to hoist equipment. The west side has pairs of three window columns flanking a large two part metal sliding door.

Test Cells 11 and 12 are at the western end **(Photograph 3)**. They do not have prominent intake and exhaust towers but are taller than the other cells. On the north and south ends are oversized, roll-up corrugated metal overhead doors. On the north a smaller, roll-up corrugated metal overhead door and metal personnel door provide access to this area. Protruding above the roofline on the north end is a small section of the building with large louvered vent openings and what appear to be metal double doors. The south side has a row of three wood-framed windows: one four-by-four flanked by two three-by-four. Test Cells 11 and 12 are separated by a control area.

B10. Significance:

This update form was prepared to provide additional information about Building 14, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70.

since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars.[3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the original design axial and formal layout. In addition to the Engine Test Cell Building (Building 14), which was started in 1940, the Navy had constructed the initial portion of Building 13 in 1941 and the following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building 14 was constructed under a lump sum contract by one of twenty-five companies working on the first phase of base construction. The western half of the building was completed in 1940, as part of the Engine Overhaul Division.[4] The building went through four phases of construction between 1940 and 1945. Johnson, Drake and Piper constructed the original building which was one of the few buildings not designed by the Bureau of Yards and Docks. The firm of Jaros, Baum, and Bolles of New York designed the first four test cells, and the building was expanded eastward to a total of ten cells in 1943.[5] The wood frame preservation shop along the north side of the building was also built in 1943 and was subsequently expanded with an addition at its western end after 1945.[6] Two 25 foot cells were added at the east end of the building in 1945. These were built larger than the previous cells for testing larger aircraft engines that were being manufactured at the
end of World War II. Conversion of test cells 3 and 4 from their original combustion engine function, to use as test cells for jet engines, was completed in 1948 (**Photograph 4** and **Photograph 5**).[7]

Photograph 4: Building 14 aerial view, first phase of construction, June 1942.

Photograph 5: Building 14 with eastern most test cells under construction at far right, ca. 1947.[8]

[8] Photographs 4 and 5 from: "History of Assembly and Repair Dept," RG 181, 3195B-C, Box 1 of 22, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).[9] Sherie Hansen, "Bothered With Jet Noise? Millions Spent in Navy Research To Whip Problem," *The Carrier*, 16 April 1969; J. L. Jensen and F.W. Schuler, brochure, n.d., Naval Air Station General, NAS Alameda Clippings Files, Alameda Free Library, Alameda, California.

After an engine was reworked or repaired by A&R, later Overhaul & Repair and then Naval Air Rework Facility (NARF), it was tested in Building 14, moving from the appropriate test cell, to the mock-up area and final check area in the preservation shop. Testing required the engine to be mounted on a test stand in one of the cells and operated from one to fifteen minutes. Noise and exhaust fumes were baffled and controlled by large mufflers, vents, and blast shields at each cell.[9] In the 1960s, NAS Alameda was one of two major air stations on the west coast actively involved in research to muffle the noise of jet engines, and this equipment was installed and replaced throughout the building. Building 14 also included a minor repair shop at the southwest corner, and an office area at the east end of the preservation shop. The blast deflector structures on the south side of Test Cells 8, 9, and 10 have been infilled, and the roll up doors on Test Cells 11 and 12 have been replaced.

Evaluation

Construction of an engine testing facility was included in the initial planning documents for NAS Alameda and Building 14 was ultimately built in stages between 1940 and 1943, with large additions at the east end in late 1945, and conversion of cells for jet engines in 1948. Although Building 14 is associated with the district's significance under NRHP Criterion A (CRHR Criterion 1), the alterations to the building during the Cold War prevent it from conveying its association with the World War II context. Building 14 does not have architectural importance under NRHP Criterion C (CRHR Criterion 3). Furthermore, the original district boundaries were drawn to include areas which were a part of a formal station plan and shared architectural similarities. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[10]

The buildings not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 14 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and that included considerable post-1945 construction.[11] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the locomotive repair shop, paint / oil storage, and engine test cells (Building 14). Research undertaken for this project in building plans, station maps, and aerial photographs indicates that the area east of the Seaplane

Lagoon on NAS Alameda was part of early plans for hazardous function and future expansion.[12] Expansion in this area began during World War II, but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. In addition, Building 14 itself lacks integrity of design, materials and workmanship, due to the many exterior changes have been done to the building since 1945, including conversion of test cells, infilling of blast wall frames, addition of access ramps at the southwest corner, and several replacement personnel and freight doors. Due to alterations of the building to service jet engines during the Cold War, Building 14, therefore, does not convey its association with the context of World War II naval facilities in the San Francisco Bay Area, and is not a contributing element of the historic district.

The history of the station during the Cold War illustrates that Building 14, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[13] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 14, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A /CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Building 14 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

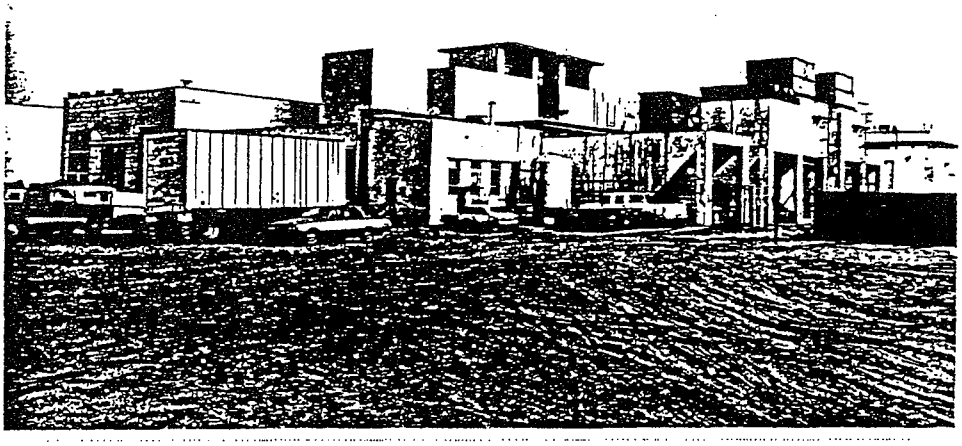
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 14, Engine Test Cell
3. Street: Fifth St., **NAS Alameda Map** S-28 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

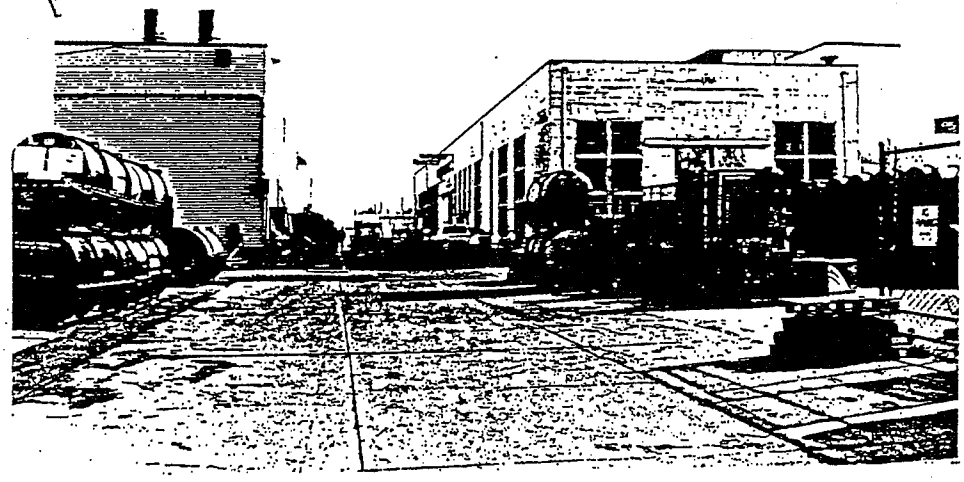
DESCRIPTION:

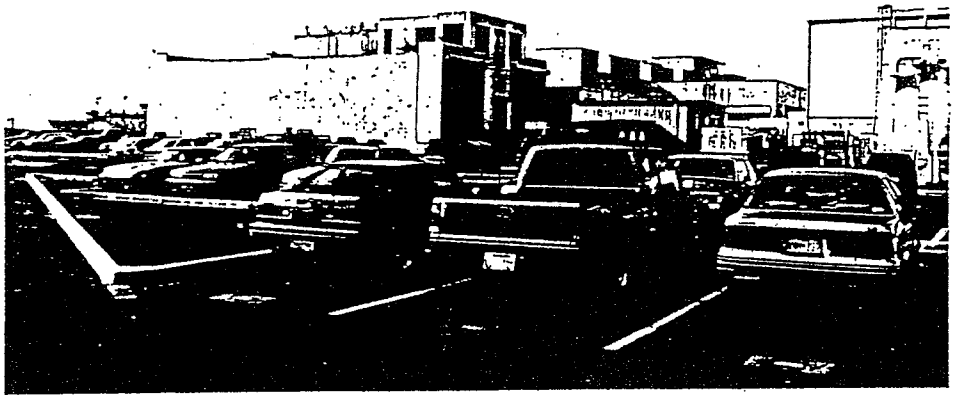
6. Property category: District Number of resources documented: 85
7. Existing condition: a very irregular, utilitarian building complex with both wooden and concrete sections of different forms and sizes. A rectangular, wood building with sliding metal doors and multiple-pane, metal-sash windows on the north side may be the original component of the complex; it is joined to a series of cell-like concrete structures ranged along the S side.

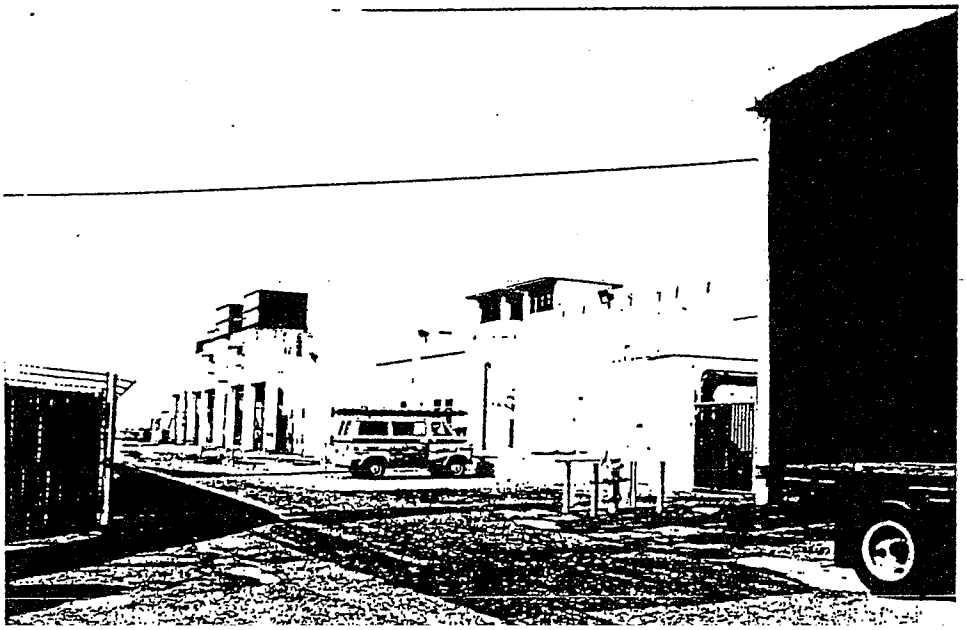
8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none



NAS ALAMEDA Building 14







HISTORICAL INFORMATION

14. Construction date: 1940. Original location: yes
15. Alterations: additions to all sides of the structures and alterations to materials and form over time, the last in 1986.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: Development of U.S. Navy Bases in the S.F. Bay Area for World War II Area: NAS Alameda. Period: 1938-1945. Property type: District. Context formally developed: yes

19. Context: Building 14 is a complex of utilitarian structures amended and much altered over time, which, because of loss of architectural integrity, does not contribute to the historic district.

20. Sources: NAS Alameda records
21. Applicable National Register categories: A and C

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 15 was not previously identified as a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP). The re-evaluation contained herein concludes that it is eligible for listing in the NRHP as a contributing element of the district. Its NRHP status code is 3D.

P1. Other Identifier: Boathouse

P2 e. Other Locational Data: 1605 Ferry Point on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 15 is a rectangular building comprised of two distinct sections which are set on concrete and wood piers and topped by a flat roof encompassing 16,603 square feet. The northeast end is two-stories while the southwest end is a one-story covered, four-bay dock. The board formed concrete two-story portion is lighted by three-over-three, one-over-one, and four-over-three windows and accessed by metal personnel doors. One door is on the main entrance on the first floor of the façade, and two are on the second floor on the northeast side reached by a metal stairway with pipe railing. The first floor entrance is covered by a small, cantilevered concrete roof. A PVC pipe and canvas canopy covers the concrete and metal walkway from the wharf to the main entrance. On the northwest side of this element is a covered boat dock bay with projecting piers **(Photographs 1, 2 and 3)**.

The one-story boat dock section of Building 15 is a combination of board formed concrete and corrugated metal sheets. The façade wall of this element is a virtual wall of windows comprised of sets of five, six-over-five windows with inset two-over-four pivot windows. A double metal personnel door with solid metal transom is centrally located in the middle bay of these windows with a metal walkway and railing; another metal personnel door with similar walkway is on the southwest side **(Photograph 2)**. The northwest side of this one-story element is open for boat entrance and docking and has three projecting piers **(Photographs 3 and 4)**.

B10. Significance:

This update form was prepared to reconsider provide additional information about Building 15, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

This context provides information on the development of the NAS Alameda Historic District and the contributions of Building 15 to the significant historical associations and architectural character of the historic district focusing on the period of significance preceding and during World War II.

The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country during the mid to late 1930s. During World War II, NAS Alameda was effectively adapted to support naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to serve and support its important wartime activities. NAS Alameda was one of three major air stations on the west coast to support operations of aircraft carrier groups, patrol squadrons, and utility squadrons, and it conducted crucial functions for aircraft assembly and repair. Following naval aviation's successes in World War II, the Navy established the aircraft carrier as a central basis for naval operations, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. NAS Alameda supported carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, and continued to carry out its main function of aircraft overhaul and repair. Much of the focus for military development during the Cold War, however, was on research and development of innovative aircraft and weapons. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of Cold War naval missions and activities.

As military tension around the world increased in the late 1930s, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur J. Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. The assertive conclusion of the Hepburn Report in 1938 was that the need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning. The Hepburn Board recommended establishing NAS Alameda as one of the major air stations on the west coast supporting both operations and aircraft assembly and repair (A&R). NAS Alameda along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program, although Congress had already approved funding for NAS Alameda in 1937.[1]

Webster, United States Army Construction Engineering Research Laboratory, "Historical and Architectural Overview of Military Aircraft Hangars," Prepared for United States Air Force Headquarters, Air Combat Command, 1999 revised 2001, 3-41 and 3-43; JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 1-1; Jones & Stokes, "Pre-Final National Register of Historic Places Nomination for the Naval Air Station Alameda Historic District" (prepared for Naval Facilities Engineering Command, Southwest and Base Realignment and Closure Program Management Office West, January 2008), 8; and Allbrandt, "History of the Naval Air Station and Naval Aviation Depot at Alameda, California" (May 1996), 2; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 229.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[2] The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. Following the Hepburn Report, BuDocks and BuAer further refined standards and requirements for naval air stations. However, local conditions necessitated alterations for improved functionality at given locations.[3] NAS Alameda followed many of the standards and requirements of the period. Yet, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report.

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The location of natural features relating to the docks and seaplane facilities determined the final placement of this interlocking system of activities. As a result of this functional organization, naval air stations designed and built in this period share similar organization with modifications for local conditions.[4]

The NAS Alameda station plan also had a comprehensive aesthetic design, in addition to its functional organization. The City Beautiful movement heavily influenced planning in the United States in the first half of the twentieth century, and can be seen in city planning as well as institutional settings such as college campuses. The movement borrowed planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, which were employed on NAS Alameda. Various *partis* or shapes, such as courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new

[2] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

Sullivan, "Base Planning," *Civil Engineering Corps Bulletin* (April 1947): 118-122.

bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [5]

BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes. In these early plans, the north-south axis ran from the north entry gate, bisected the entry mall and Building 1, and terminated at the center line of the Seaplane Lagoon to the south. The original east-west axis bisected an open area separating the living quarters / administrative core from the shops and operational portion of the station, and was aligned with the middle of the airfield on the west end of the station. The operational areas like the Seaplane Lagoon were sited either directly on the axial line or paralleled an axis.

The importance of waterfront activities is illustrated in the Navy's construction of the Seaplane Lagoon before the landplane airfield and that the Seaplane Lagoon was a critical feature in the design of the station layout highlighted by its symmetrical location on the main north-south axis of the station plan. The heavily trafficked Oakland Inner Harbor along the north side of the station was not a suitable location for seaplane operations, so the lagoon was placed at the south end of the axis, with access to open landing water. Its layout was nearly bilaterally symmetrical to the land area of the station, except where the railroad spurs serving the piers clipped the southeast corner of the lagoon, the alignment of which existed prior to Navy acquisition of the site. The east and west sides of the lagoon adjoin or were placed in line with two of the main north-south streets that flank the Shops and Administrative Core areas that form the main area of the station. The north-south measurement of the lagoon is equal to and correlates with the distance from Red Line Avenue to Tower Avenue that flanks the other sides of the Shops and Administrative Core areas. The original Airfield was subject to similar axial and proportional considerations. As a result, the Seaplane Lagoon is nearly the same size as the core of the station and the original Airfield.

In addition to the careful master planning for the station following principles of organization, functionality, hierarchy, and efficiency, the Navy also designed prominent buildings on the station in a manner that corresponded with the efforts to create a modern and organized facility. This was achieved by adhering the station's plan to a Beaux Arts formal spatial layout and by designing most of its prominent buildings in the Moderne style, which blended neo-classical proportion, symmetry, and order with modern design concepts of the time.[6] The planning and architecture on NAS Alameda demonstrate trends which BuDocks designers drew upon related to campus planning, modernistic design, and the continued traditional architectural expressions of federal buildings during this period.

Architects worldwide began to abandon historical revival styles during the late 1920s and especially during the 1930s in favor of designs that consciously illustrated modernity and technological progress using simplified geometric forms and ornamentation. This trend developed mostly from European modernistic art and industrial design, but transferred to architecture wherein it presented sleek and spare designs of the Art Deco, Moderne and later International styles. Often buildings designed in the new style(s) of the period retained proportion, symmetry, and order found in buildings inspired by Classical architecture, but without direct allusion to historical styles. Materials such as concrete, metals, and glass block – all of which were used on NAS Alameda – were prominently used to illustrate a directness regarding building fabric to help portray the machine / technological-inspired aesthetic The rapid evolution of aviation

[5] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003) 319-320.

[6] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

and other forms of transportation during the 1920s and 1930s particularly inspired designers to illustrate in architecture and industrial design modern society's departure from the past that was seemed apparent, or was being sought, at the time. The expansion of civilian and military aviation was symbolic of modern technological achievement and streamline forms appeared in and influenced the design of seaplane and landplane aircraft as well as in the buildings of the growing nationwide network of civilian airports. Modest buildings on NAS Alameda, like Building 15, lacked ornament and depended upon proportion and simple form to provide their architectural interest.

The Boathouse, Building 15, was constructed as a part of the organizational and functional plan for the station using the prescribed building style. The contract for the construction of the boathouse was among the first building contracts awarded, and Central California Construction Company completed it in 1940. The building is located within the Seaplane Lagoon at a location that early plans showed was to be used for operational facilities. Its location reflected its direct functional relationship with ships at the pier, wharf, and seaplanes in the lagoon as part of waterfront operations.[7]

The boathouse was a part of the Operations Department on NAS Alameda, which was charged with flight and sea operations. Docking, undocking, and other ship movements were conducted through the Boats and Docks Branch located in the boathouse. The branch boats, located at the boathouse, assisted with ships arriving or departing NAS Alameda. In addition, the Boat and Dock Branch boats maintained the seadrome located south of the piers and breakwater where seaplanes landed and took off. Boats cleared the seaplane take off and landing areas of debris, beached and docked the seaplanes in the Seaplane Lagoon, and lighted, extinguished, and maintained the lights outlining the seadrome area. Other duties included training new crewmen on boat runs to familiarize themselves with the rough San Francisco waters and currents. The boathouse also maintained a fireboat and Crash Crew Operations boats to handle emergency operations as part of the Boats and Docks Branch.[8]

The rapid increase in personnel and activity during World War II required additional facilities. In peacetime the Navy had a phased program to build the station, which likely would have taken years to complete. Many of these phases were rapidly speed up and completed during the war years. Like many of the buildings on NAS Alameda prior to World War II Building 15 expanded through the war. Between 1940 and 1945 Enlisted Men sleeping quarters were extended in the boathouse in four phases, one of which was in 1943(**Photograph 5**).[9]

Photograph 5: Boathouse (Building 15), September 1, 1945.[10]

Throughout the war years, NAS Alameda served a valuable role in naval operations and demonstrated the critical role aviation had within Navy strategy and operations. Swarms of Navy and civilian personnel carried on activities aimed at providing support services to the striking arm of the fleet. Its training facilities prepared service personnel for duties in forward areas, and air crews in flight operations. Its shops and repair facilities assembled aircraft and returned battle-damaged aircraft to the fight. It provided a homeport for combat ships, and a resupply and service location for their crews and equipment. It continued its function for waterfront operations after the war and during the 1950s.

In the 1960 and 1970s the mission and function of the Boats and Docks division, including Building 15, was to salvage water crash victims in the San Francisco Bay area, assign berthing space for all ships at NAS Alameda piers, to assist ships in docking and undocking and provide service requested by logistic requirements to all vessels berthed at the piers, and to control and clean up all oil spills at the piers. Boathouse personnel had developed their own equipment to handle oil spills to emulsify and sink heavy oils.[11] By 1972, small craft berth was listed as a secondary function of the building.[12]

Evaluation

In terms of Building 15's place within the existing NAS Alameda Historic District, this evaluation suggests that it is a contributing resource because of its shared association with other contributors to that district's significance under Criterion A, for its contribution to the nation's defense during World War II, and under Criterion C, for its style and architectural importance. The original district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[13]

Woodbridge considered Building 15 a non-contributor to the district because of its isolation from other buildings and structures within the NAS Alameda Historic District. Previous evaluation had recognized its historical association with the district and research confirms this association. Reconsideration of the district boundaries and evaluation of the Seaplane Lagoon has expanded the district to include the lagoon. Projecting into the lagoon, Building 15 is within the historic district. The lagoon and waterfront features like Building 15 were an important part of station operations and the total base design of NAS Alameda. Due to the reconsideration of the NAS Alameda Historic District boundaries, Building 15, located on the Seaplane Lagoon, is now within the NAS Alameda Historic District. In addition, the building retains sufficient historic integrity to the historic district's period of significance.

Building 15 is a contributor to the NAS Alameda Historic District, which is significant at the state level under NRHP Criterion A and NRHP Criterion C. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development during the period of significance 1938-1945. Building 15 is significant for its association with the historic district's importance in naval air station development and the role NAS Alameda served during World War II. In addition to its historical significance, Building 15 also retains sufficient historic integrity to convey its significance to the historic district's period of significance.

Under Criterion A, Building 15 is a contributor to the NAS Alameda Historic District because of its important role in station waterfront operations and its association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the station's role in Pacific theater naval operations during World War II. Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention given to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and

[13] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," 1992. 1-2, 11-12.

functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and then successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. Building 15 provides a direct link to NAS Alameda's initial development and its support of a central and vital role in the Pacific theater.

Under Criterion C, Building 15 is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation. Building 15's location in proximity to both the piers and seaplane lagoon demonstrates the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period, and it shows the magnitude the Navy placed on the design to illustrate the modernity and importance of the naval aviation strategy for the Pacific Fleet. The building's integration with the overall architecture of the station focusing on smooth wall surfaces, horizontal orientation and flat roofs further support the importance placed on the design. Completion of the station plan was sped up and successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional design enabled the station to rapidly expand to serve and support this important wartime activity.

The station does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

Building 15 is significant and it retains sufficient historic integrity to convey that significance. It has the physical features that relate to its significance, and it retains elements of all aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

Building 15 shares character-defining features with many of the shop facilities on NAS Alameda as identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[14] The main character-defining element of these buildings, and Building 15, is the poured concrete building material, and smooth surface. With such a simple building material the smaller features such as windows become character-defining. In this case, the large windows providing light to the covered docks are especially defining. The covered docks at the southeastern portion of the building with their associated docks and pilings characterize the use of the building. No interior character-defining features were identified for Building 15.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and

development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[15] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 15, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Building 15 does not individually possess Cold War-era significance, this building meets the criteria for listing on the NRHP as a contributing element of the NAS Alameda Historic District (NRHP Status Code 3D).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current: Building 15, Boathouse
3. Street: Fifth St. **NAS Alameda Map:** V-27 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Map Quad No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a two-story concrete building with a flat, parapeted roof and a rectangular plan, attached to a long one-story wing clad in corrugated metal. Typical windows on the concrete block are metal-framed and have 6-light, hopper sash. An entrance door on the SE side has a small, concrete slab roof pro-jecting from the wall above. A stairway leads to a door on the upper floor of the NE side. The wing has large glazed openings on the SE side with metal mullions and multiple-light, hopper sash and a metal door; the water side of the wing is open. The building stands on pilings in the water and has gangways bridging the water leading to the entrances.

HISTORICAL INFORMATION

14. Construction date: 1940 Original location: yes
15. Alterations: metal siding put on building in 1989
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context fully developed: yes
19. Context: Although Building 15, the boathouse, is one of the early base buildings, it is located, like its neighbor, Building 64, in an area far removed from the central core of early buildings. On-going construction in this area has changed the early appearance of the base. The building was altered in 1989, but still retains a high degree of integrity. Architecturally, it has no distinguishing features, and, because of its isolation, does not contribute to the NAS Alameda Historic District.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

State of California — The Resources Agency **Primary #** P-01-010014
DEPARTMENT OF PARKS AND RECREATION **HRI#**
CONTINUATION SHEET **Trinomial**

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder): Building 16
***Recorded by:** M. Bunse and C. Brookshear ***Date:** September 25, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 16 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Medical Clinic

P2 e. Other Locational Data: 2600 Saratoga Street; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 16 is a 39,130 square foot U-shaped Streamline Moderne building with a flat roof. The north wing is three stories, while the west wing and south wing are two stories. Building 16 is almost entirely made of poured concrete with the exception of the rear section of the south wing, which is clad in horizontal wood siding. At the northwest corner of the building is a three story element protruding from the roof of the west wing, and a four story element protruding from the roof of the north wing. This last appears to be a stairwell providing access to the roof.

The buildings clean, angular lines are interrupted only at the main entrance on the northwest corner of the building. Here, the corner of the two-story west wing is rounded as it meets the north wing. The center horizontal band of concrete which runs between the first and second story windows of the west wing continues past the corner to provide a shelter for the entrance before it too curves to meet the north wing. The entrance is slightly recessed and has three sets of full glass double doors accessed by a staircase of seven concrete steps with metal pipe railings.

The windows on all sides of the building are set in horizontal bands mostly consisting of two-over-two, metal frame windows in groups of four. These sets are broken by concrete dividers which are scored into four sections to mimic the windows. While this pattern is predominate on the building, there are some exceptions. One the east end of the north wing there are sets of one, two, three windows occurring on the building, largely in the rear. In some places the concrete divider is also not present. Several window bays on inside of U section of the south wing are filled in with glass blocks, while some windows are boarded up with plywood.

Other doors include a metal personnel door on the west side accessed by concrete stairs with a metal pipe railing. On the south side near the rear of the building is the same type of door on the second floor accessed by a metal staircase. The east end of this wing also has a single-bay, metal roll-up garage door. On the inside of this U-shape are several other doors. These include two sets of double doors and two single personnel doors which open onto a concrete loading dock accessed by a ramp on one end and concrete stairs on the other. Also on this side of the building is another second story window accessed by a metal staircase from a second, small loading dock covered by a cantilevered roof. On the east end of the north wing are three additional personnel entrances. On the first floor is a recessed set of metal doors accessed by concrete stairs with metal pipe railing. On the second and third floors are doors accessed by the same metal stair case.

B10. Significance:

This update form was prepared to provide additional information about Building 16, to assess if it retains integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Johnson, Drake and Piper constructed Building 16 in 1942 as a dispensary. The medical and dental departments of NAS Alameda moved from the second floor in Wing 2 of Building 2 into Building 16 upon completion in 1942. The mission and function of the Dental Department was to provide dental treatment for the station, station tenants, and ships home ported at NAS Alameda. The mission of the dispensary was to provide for the preservation of health of the personnel assigned to the Station, to care for the sick and injured and to supervise the hygiene and sanitation of the Station and recommend measures to prevent or diminish disease or injury.[2]

The dental department occupied the entire north wing of Building 16. In 1946, the dental department was established as a separate department and by 1958 had a prosthetic laboratory, x-ray and dark rooms, and 12 dental operating rooms. A dental technician program was established the same year. In the 1970s the medical galley was converted to a Plaque Control Center for training purposes and the medical and dental exam and treatment rooms were remodeled.[3]

Evaluation

Building 16 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[5] These are detailed on the attached sheets, and include smooth concrete surfaces of the building, horizontal orientation, flat roofs, emphasizing vertical elements (such as the stacked windows on the north side), curved contrasting elements (especially the curved entry elements in Photograph 1), original and sympathetic two over two windows, and quoin-like dividers between windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 16, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 16 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

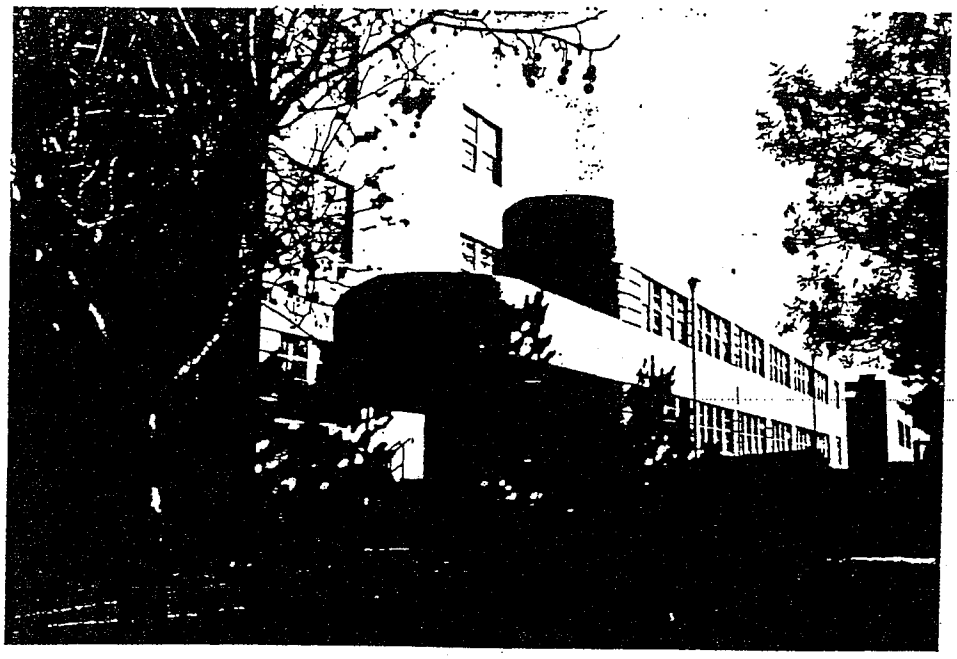
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

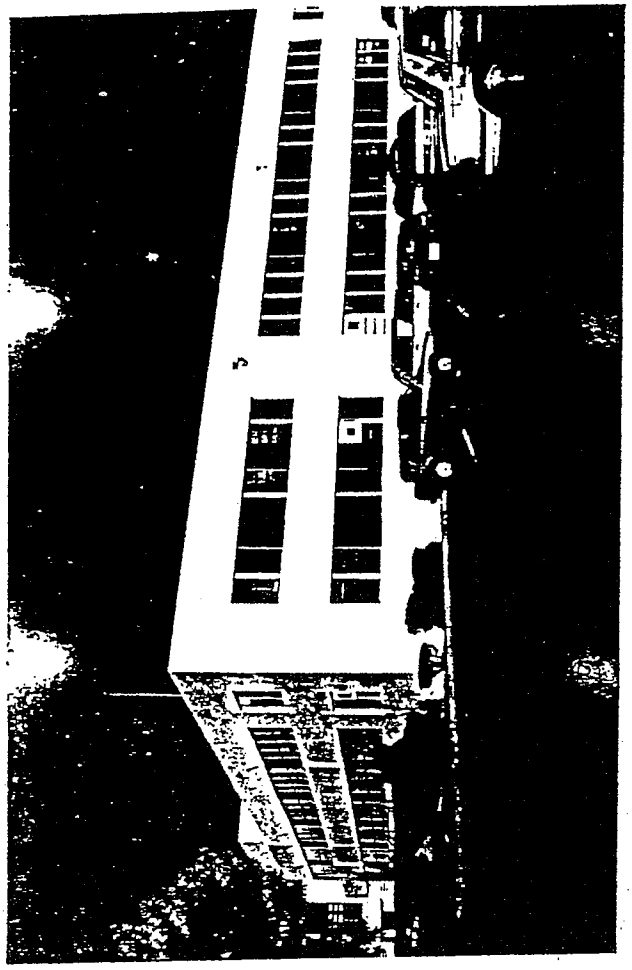
1.&2. Historic/Current name: Building 16, Medical Clinic
3. Street: Third St. at Ave. B **NAS Alameda Map** L-24 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W11215/7.5

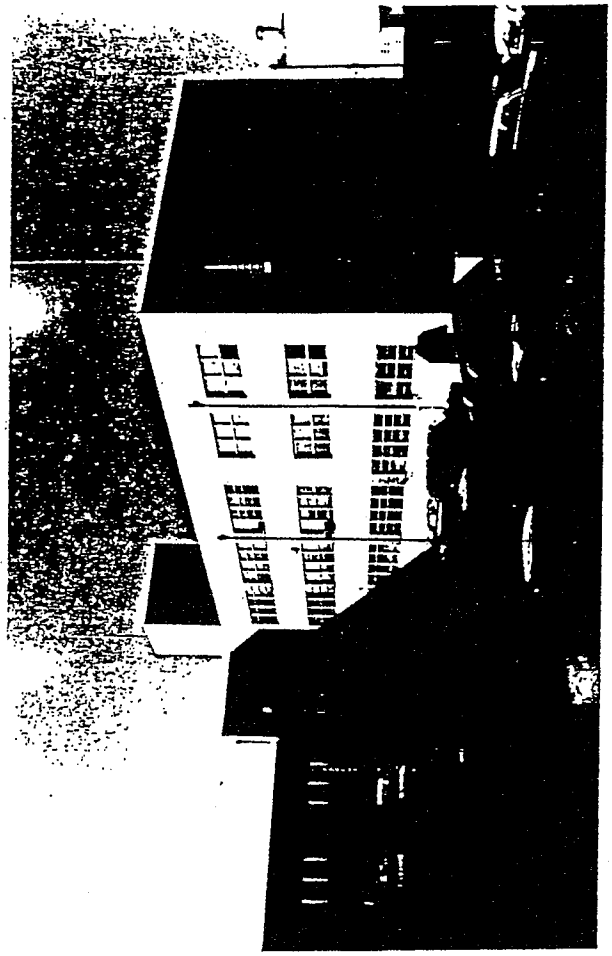
DESCRIPTION

6. PROPERTY CATEGORY: District Number of resources documented: 85
7. Existing condition: a three-story, concrete building, 147 ft. by 44 ft, with a flat, parapeted roof and a U plan. The entrance, which has two sets of double metal doors, on the W side is raised up a short flight of concrete steps with metal railings and sheltered under a roof with a curved parapet that abuts into the building facade on one side and merges with the upper floor wall on the other side of the entrance. The upper floor projects from the three-story part of the building and is curved to match the entrance parapet. The curved corners of the walls and the walls between the windows are scored with lines that match those of the metal-framed, hopper sash with two-over-two lights. The same fenestration is used on the rest of the building as is the pattern of scoring. Fire doors and other entrance doors are located on the ends and other parts of the building. The elevator tower rises from back of the third story. The building was altered in 1989, but retains a high degree of integrity and appears unchanged.

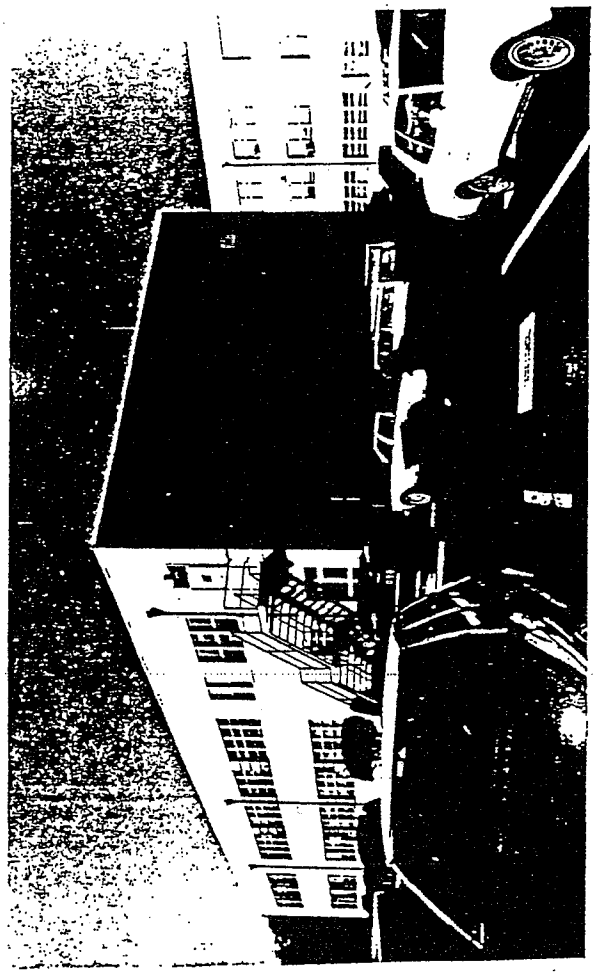
8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none







NAS ALAMEDA Building 16



HISTORICAL INFORMATION

14. Construction date: 1942. Original location: yes
15. Alterations: Exterior alterations to the back of the building in 1989
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: n/a
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally documented: yes

19. Context: Building 16, the Medical Clinic, contributes to the NAS Alameda Historic
District under Criterion A because it was built in 1942 in the core area of the base, which still conveys a strong impression of the air station during the period of significance. Under Criterion C, the Medical Clinic was designed in the simplified early Modern style of the permanent buildings in the core area.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

- Horizontal orientation with strong vertical emphasis in the entry pavilion (see Photograph 2).
- Horizontal concrete bands, or quoins.
- Curved planter boxes and concrete barriers at doorways.
- Curved concrete canopies.
- Five-light original doors (See Photograph 11).
- Some original two-over-two double-hung wooden windows and appropriate aluminum double-hung replacement windows.
- Stacked windows and cast-stone ornamentation at entry pavilion (see Photograph 24).

3.3. Character-Defining Elements of Buildings 2, 3, and 4 (also Building 63 and 193)

Buildings 2, 3, and 4 are best considered as a single entity. The buildings are united structurally via a massive arcade, which runs nearly the length of Buildings 2 and 4 and across the front of Building 3. Buildings 65 and 193 are relatively minor appendages to Building 3. This group of buildings arguably includes the best that the NAS Alameda Historic District has to offer. Virtually all character-defining elements found within the Administrative Core generally may be seen on these buildings.

Among the key character-defining elements are:

- Strong horizontal orientation with vertical elements for emphasis. The key vertical elements include the stairwells at the eastern end of Buildings 2 and 4, and the tall columns at the facade of Building 3.
- Quoin-like features.
- Cast stone figures, including the Pegasus figures at Buildings 2 and 4 and the eagle figures at the entrance to Building 3.
- Many original two-over-two double-hung wooden sash on the second story of Building 2.
- Sympathetic aluminum two-over-two double-hung sash in Buildings 2 and 4.
- Steel sash in Building 3.
- Three-light wooden doors.
- Oval columns and long arcade.
- Concrete planters and seating area.

3.4 Character-Defining Elements of Building 16.

Building 16 is a large U-shaped, two-story, flat-roofed concrete building, located immediately east of the Administration Building. It is characteristic of the general horizontal orientation of the buildings in the Administrative Core. More than any other building in the district, however, it typifies the sweeping curved concrete surfaces of the Streamline Moderne style; as noted, it is the most pure example of Streamline Moderne within the historic district. Character-defining elements include:

- Concrete surface.
- Flat roof.
- Quoin-like elements at corners and wall panels separating windows.
- Sweeping curved concrete surface at entrance.

3.5. Character-Defining Elements of Building 17.

Building 17 is one of the most dramatic structures within the historic district, nearly rivaling the Buildings 2, 3, and 4 complex for sheer size and structural complexity. Building 17, however, is a far different building architecturally, being the most frankly modern building in the historic district and containing virtually no neo-classical elements. Building 17 is also of interest for its lack of Streamline Moderne features. While it has some stacked vertical elements, it has no horizontal bands and very few curved elements, commonly found elsewhere in the historic district. The character of the building is defined by its rather austere modernity, mostly intact and unmodified. These character-defining elements include:

- "Stacked" concrete vertical elements at end of eastern and western wings.
- "Stacked" windows and concrete balconies at northern entry.
- "Stacked" glass block windows at sides of northern entry.
- Sympathetic two-over-two, double-hung aluminum windows.
- Some original five-light doors.
- Concrete canopy over rear loading dock; this is shown in **Photograph 32.**
- Curved concrete entry on north facade.

3.6. Character-Defining Elements of Building 18.

Building 18 functions as two buildings -- the theater and the post office -- and includes two structural elements that are very different from each other. There is a also a wood frame with stucco postal sorting area at the end of the post office; this appears to represent an early addition to the building, likely built during World War II. The only notable modification to the building was the installation of a metal screen at the front of the theater building, covering a characteristic set of stacked windows. Among the character-defining elements of this building are:

- Smooth concrete surface.
- Tall-two-story theater wing and low-slung post office wing.
- "Stacked" vertical element in theater wing (see Photograph 25).
- Arcade, including oval concrete columns, in post office wing (shown in Photograph 18).
- Original two-over-two wooden double-hung sash in mail sorting area of post office.
- Generally sympathetic aluminum two-over-two double-hung windows elsewhere.
- Characteristic curved entry to post office area.
- Characteristic concrete canopy at rear loading dock.

CONTINUATION SHEET **Trinomial**

Page 1 **of** 9 ***Resource Name or #** (Assigned by recorder) Building 17
***Recorded by:** C. Brookshear and K. Clementi ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 17 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Bachelor Officers' Quarters

P2 e. Other Locational Data: 700 W. Essex; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 17, the Bachelor Officers' Quarters (BOQ), remains as previously described **(Photograph 1)**. The building consists of an east-west cross wing with U shaped wing attached to either end. Another wing projects from the center of the east-west cross wing to the south for a total of 144,133 square feet. The building has a main entrance on the north side of the east-west cross wing **(Photograph 3)**, and three entrances facing the courtyard of each U. The main entrance is centrally located **(Photographs 3 and 4)**. A three story stair tower is just to the east (left) with horizontal bands of glass block windows wrapping around the northeast corner of the tower. A concrete planter surrounds the tower. A long porch and second floor balcony extent to the west (right) of the entrance. First floor fenestration along the length of the porch has been modified to single windows instead of bands. The main entrance is a pair of metal-framed glass doors. The three story U shaped wings have entrances and stairs at each outside corner. Entrances facing the courtyard at the base of each U have stairs leading to a pair of doors set into a recess with curved sides **(Photograph 5)**. Above the entrance is a small balcony with a single door and small flat rectangular concrete roof. The doorway is flanked by two rectangular concrete planters. Similar doors without the balcony are located facing the courtyard on each side of the U. The central entrance on the east has been modified with a wheelchair ramp. South of the west entrance is an emergency stair with metal first floor door and a column of horizontal single light windows above it.

The south wing includes a single story rectangle projection to the south with a two-story square located to the east of that rectangle **(Photograph 6)**. A loading dock runs along the west side of the central wing and a personnel door with curved protective roof is located at the corner where the wing joins the central corridor.

Similar to many buildings on NAS Alameda, the interior of the BOQ has been modified consistently since its construction. However, characteristic elements of the building remain; they include: large open spaces, curved staircases and their metal handrails, and the use of glass block in windows and room dividers **(Photograph 7)**. The building has been vandalized and many of the glass block sections are now destroyed. The building retains features such as small telephone booths and terrazzo flooring that reflects the era in which the building was constructed **(Photograph 8)**. The terrazzo flooring and the tile in the lavatories may be original materials **(Photograph 9)**. The kitchen area is characterized by tiled walls and floor and has industrial metal sinks along the east wall **(Photograph 10)**. While the large open plan of this area is true to the original design, the materials within it may be part of a later refurbishment.

B10. Significance (cont.):

This update form was prepared to provide additional information about Building 17, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Construction of Building 17 began in early 1940. By September of that year designers developed a new plan for the station and the building began to develop the four wings it has today. Construction was phased through 1941, adding wings as additional staff arrived on station **(Photograph 10)**. In 1943, as the station and personnel housing grew, a 200-seat mess hall was added to the BOQ. In addition to food and lodging, other services could be found at the BOQ including a barber shop and a ward recreational room. By 1963 an instructional center was opened in the building.

Page 8 **of** 9 ***Resource Name or #** (Assigned by recorder) Building 17
***Recorded by:** C. Brookshear and K. Clementi ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

Throughout the life of the building suites and other facilities in the BOQ were constantly remodeled and upgraded. For example, a new barbecue area was built in 1968 the front doors were replaced in 1973 with automatic doors. In the early 1970s, many bachelor officers chose to live off station leaving many units in Building 17 empty. Most of the residential units were designed for two men per room with two rooms sharing a bathroom. As a result of fewer men living in the BOQ, the Navy provided the officers living there two room suites, each with his own bathroom. The Navy remodeled the interior during the 1980s when the building's connection to the base's steam heating system was replaced with a stand-alone heating / air-conditioning system. Changes included a lowered ceiling bump-out corners in the hallways, new carpeting, and coffered ceiling insets at hallway intersections. In March 1993 a handicapped ramp was added on the east side of the building. The Bachelor Enlisted Quarters (BEQ) and the BOQ combined into the new Combined Billeting Quarters (CBQ) in 1996. A retail outlet was also opened inside Building 17 in that year. The building is now vacant and has been vandalized.[2]

The BOQ had a large painting in the dining room that featured women in a grape harvest scene. The painting was done during World War II by Robert E. Weaver (Lt. JG) in the expressive realism style of that period. The painting is no longer in the building and was likely removed when the station closed. Weaver painted multiple large pieces on station during the war. He later went on to a career as a painter and illustrator.[3]

Evaluation

Building 17 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station

[2] Bureau of Yards and Docks (BuDocks), "US Naval Air Station Alameda, Bachelor Officers' Quarters First Floor Plan West Wing," Yards and Docks #139392, February 20, 1940; BuDocks, "US Naval Air Station Alameda, Additions to Bachelor Officers' Quarters Plot Plan and Details - Plumbing," Yards and Docks #147785, September 14, 1940; BuDocks, "US Naval Air Station Alameda, Extension to Bachelor Officers' Quarters Second Floor Plan Roof Plan and Heating Layout," Yards and Docks #163875, June 4, 1941. These original BuDocks plans are located in Drawer 11 600 Block Essex, Plan and Maps Room, Alameda City Hall West (Building 1 former NAS Alameda), Alameda, California; Department of the Navy, Bureau of Yards and Docks, *NOy Contracts*, NOy 4165, Folder 3 of 23, Box 25, RG 12,CEC/Seabee Museum, NBVC, Port Hueneme, California; Department of the Navy, Bureau of Yards and Docks, *Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume IV, Districts 12 through 14, 1942 - 1963*, Box 38, RG 8,CEC/Seabee Museum, NBVC, Port Hueneme, California; Dick Rutter, oral interview with JRP, December 18, 2009. Mr. Rutter lived in the BOQ when he was assigned to NAS Alameda; US Navy, *1993 Command History*, Box 2 of 2, 5757-1b, Naval Air Station Command History, 30 Volumes, 1968-1997, Record Group 181 US Naval Shore Establishments, National Archives and Records Administration, San Francisco.

Alameda Historic District."[5] These are detailed on the attached sheets, and include smooth concrete surfaces of the building, horizontal orientation, flat roofs, emphasizing vertical elements, curved contrasting elements, original and sympathetic two over two windows, five light wooden doors, and quoin-like dividers between windows, Vertical elements include the raised concrete 'stacked' features at the east and west ends of the U shaped wings, 'stacked' windows and concrete balconies at the north entry, and the 'stacked' glass block windows at the sides of the north entry. Curved contrasting elements include the north entry and concrete canopy over the rear loading dock. Some of these features are reflected on the interior, notably the windows and glass block and a slight curve to the base of the stairs.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 17, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 17 is a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 17, Bachelor Officers Quarters.
3. Street: Aves. B and C & Fourth and Fifth Sts. **NAS Alameda Map** L-26
City: Alameda Zip: 94501 Country: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a two-story, concrete building composed of two U-shaped wings aligned N-S connected with an E-W cross-wing , which has a rectangular block on the S side; the function of the building as a dormitory explains the plan. Two-tier stair towers are set within the ells of the wings. Walled balconies on the upper level and walled terraces on the ground level reached by short flights of concrete steps with metal railings encase the stairwells, which are fenestrated with a grid of small, rectangular openings. Typical elevations are punctuated with metal-framed windows with 4-light hopper sash, which are paired near the end-bays of the walls and grouped in sixes in the other four bays; these windows are separated by smaller windows on each floor. Two metal downspouts enframe the two central bays. The ends of the wings have slightly projecting wall-sections perforated with a grid of two vertical ranks of small, rectangular openings. The S-facing block in the center of the building has a service entrance raised on a concrete platform and reached by two flights of steps which is sheltered by a concrete slab projecting from the wall above the double entrance doors. The block is fenestrated with the standard metal windows.

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Are for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Building 17 contributes to the NAS Alameda Historic District under Criterion A because it was built in 1941 as part of the early central core of buildings on the base, and has continued to serve its original function of Bachelor Officers Quarters. Under Criterion C, the building is representative of the simplified Modern style in which the permanent buildings were de-signed and has a high degree of integrity.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C

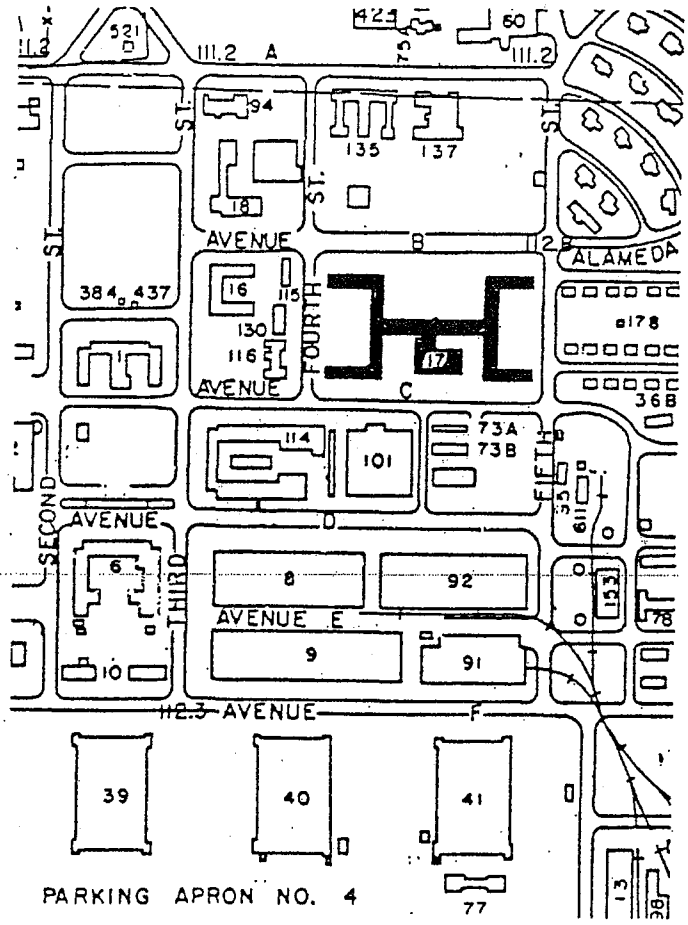
Address: 2273 Vine St., Berkeley, CA 94709 Phone: (415) 848-4356



JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

- Concrete surface.
- Flat roof.
- Quoin-like elements at corners and wall panels separating windows.
- Sweeping curved concrete surface at entrance.

3.5. Character-Defining Elements of Building 17.

Building 17 is one of the most dramatic structures within the historic district, nearly rivaling the Buildings 2, 3, and 4 complex for sheer size and structural complexity. Building 17, however, is a far different building architecturally, being the most frankly modern building in the historic district and containing virtually no neo-classical elements. Building 17 is also of interest for its lack of Streamline Moderne features. While it has some stacked vertical elements, it has no horizontal bands and very few curved elements, commonly found elsewhere in the historic district. The character of the building is defined by its rather austere modernity, mostly intact and unmodified. These character-defining elements include:

- "Stacked" concrete vertical elements at end of eastern and western wings.
- "Stacked" windows and concrete balconies at northern entry.
- "Stacked" glass block windows at sides of northern entry.
- Sympathetic two-over-two, double-hung aluminum windows.
- Some original five-light doors.
- Concrete canopy over rear loading dock; this is shown in **Photograph 32.**
- Curved concrete entry on north facade.

3.6. Character-Defining Elements of Building 18.

Building 18 functions as two buildings -- the theater and the post office -- and includes two structural elements that are very different from each other. There is a also a wood frame with stucco postal sorting area at the end of the post office; this appears to represent an early addition to the building, likely built during World War II. The only notable modification to the building was the installation of a metal screen at the front of the theater building, covering a characteristic set of stacked windows. Among the character-defining elements of this building are:

- Smooth concrete surface.
- Tall-two-story theater wing and low-slung post office wing.
- "Stacked" vertical element in theater wing (see Photograph 25).
- Arcade, including oval concrete columns, in post office wing (shown in Photograph 18).
- Original two-over-two wooden double-hung sash in mail sorting area of post office.
- Generally sympathetic aluminum two-over-two double-hung windows elsewhere.
- Characteristic curved entry to post office area.
- Characteristic concrete canopy at rear loading dock.

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder): Building 18
***Recorded by:** M. Bunse and C. Brookshear ***Date:** September 25, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 18 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Post Office and Recreation

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The 39,130 square foot Post Office and Recreation building remains as described in 1992. From above, and looking at the east elevation, it is clear that the theater at the south end of the building is three stories while the post office and office wing extending to the north is one story **(Photograph 1)**. The post office is deeper than the adjoining offices creating an irregular east façade. A roughly square sorting room is attached north of the customer service portion, but is not flush with the full length porch. The porch columns are actually oval and mimic the colonnade of the Bachelor Enlisted Quarters (Buildings 2 and 4) across the mall. Surrounding the theater entrance is a concrete terrace with incorporated concrete planters. The terrace surrounds both the main (west) entrance and a second (south) entrance with a cantilevered protective roof. This secondary entrance has been enclosed. The theater also has entrances with concrete stairs and planters at the far end, on the north and south sides. These doorways are set in smaller tower like projections with a grid of six tall two over two windows. The rear (east) side has two loading areas. The first is where the offices meet the theater. It consists of a concrete platform leading to a pair of doors with a rectangular flat concrete overhang **(Photograph 2)**. A window and doors to equipment are located in a recess off the platform. The rear of the post office has another platform **(Photograph 3)**. This platform is sheltered by a full width and depth metal roof. The central portion of this roof is concrete and curves out from the post office wall. A pair of doors is centrally located and flanked on one side by mechanical equipment mounted to the dock. The rear of the post office addition has two overhead doors at truck bed height for additional loading and unloading.

The interior of Building 18 retains a Moderne look in the theater; however, this is a result of recent modifications made to the building in the 1990s **(Photograph 4)**. Only a few original elements were retained and incorporated into the redesign of the theater portion, such as the vent structures on the ceiling and the metal vents along the base of the stage. The interior of the post office portion of Building 18 has also been modified over the years; however it retains the original two-over-two wooden double-hung sash in the mail sorting area of the post office. These windows are the single, interior character-defining feature of Building 18.

B10. Significance (cont.):

This update form was prepared to provide additional information about Building 18, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 18 is divided into three main sections: an 18,166 square-foot general purpose auditorium, a 5,293 square-foot post office, and a 2,288 square-foot educational service office. Construction of Building 18 began in February 1938 and was completed in 1941 under contractors Moore and Roberts out of San Francisco for a total cost of $274,134.51. In July 1942, the Post Office was moved from its temporary placement in the Administration Building

[1] US Navy, "Theater," #121-6, May 1945, California – Alameda – pictures; maps; justifications, National Geographic File, Geographical Collection 1800-present, RG 5, CEC/Seabee Museum, NBVC, Port Hueneme.

to its permanent location in Building 18. Between 1944 and 1945 an office extension was added to the north side of Building 18, into which the Post Office expanded **(Photograph 5)**. By the 1950s office space within Building 18 was reserved for the insurance office in addition to the already existing post office and theater. In 1965 the Family Services Center was established on base and located in Building 18. This service was later relocated to its own building (Building 613).[2]

Building 18 underwent internal modifications and use during the 1970s. On July 28, 1975 the south side Theatre portion of Building 18 was closed for refurbishment and reopened in January 1976. This over $100,000, six month renovation included repainting, re-carpeting, and numerous remodels of its interior. Exterior changes included new paint and the addition of glass doors leading into the remodeled lobby. Additionally, by 1978 the Chaplain's office was located in Building 18; however worship services and religious education was carried out elsewhere on base. Another late addition to Building 18 included the Navy Occupational Safety and Health (NAVOSH) office, which was established to create a safe and healthy working environment on base during the 1990s.[3]

Building records note improvements were made to the building in 1987, but do not specify the type of modifications. At the time of base closure, Building 18 included the theater, post office, and safety office and as of 2008 the building continued to be divided into those three sections. In the mid-1990s Allen Michaan renovated the theater once again into the "Auctions by the Bay Theater." The million dollar renovation incorporated removable Art Deco features. Michaan also remodeled the space behind the theater to use as his auction house bidding room. The most significant alteration to Building 18 is the addition of a new façade on the Theater. The panels of windows recessed into the second and third stories of the original façade have been replaced with an Art Deco style panel. Aside from the alteration to the façade including the replacement of doors, Building 18 remains predominantly unaltered and in its original location.[4]

Evaluation

Building 18 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[5] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[6] These are detailed on the attached sheets, and include smooth concrete surfaces of the building, a tall theater contrasting with low post office, flat roofs, emphasizing vertical elements, curved contrasting elements, original and sympathetic two over two windows, oval columns along the arcade, and incorporated planters.[7] The dominant vertical element is the 'stacked' windows above the theater entrances. Curved elements include the entries to the post office and theater and the concrete canopy on the rear loading dock.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 18, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C/ CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 18 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

***B14. Evaluator:** M. Bunse and C. McMorris

***Date of Evaluation:** January 2010

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. **Historic/Current name:** Building 18, Post Office and Recreation
3. **Street:** Third St. **NAS Alameda Map** K-25 City: Alameda Zip: 94501
   County: Alameda Code: 001
4. **UTM Zone:** Oakland West, CA
5. **Quad Map No.:** N3745-W12215/7.5 Parcel No.: none

DESCRIPTION:

6. **Property category:** District Number of resources documented: 85
7. **Existing condition:** an irregular, L-plan, concrete building, of one to three stories with flat, parapeted roofs. The main elevation, 100 feet long, is composed of the one-story post office at the N end and the three-story theater and office building at the S end. The post office entrance is raised four steps and set in a deep reveal with rounded walls. Concrete planters flank the steps, and a grid of six small square windows is set on each side of the doorway. To the south of the entrance is a recessed porch with square concrete columns also reached by a short flight of concrete steps with metal railings. Typical windows are paired and have metal frames with hopper sash. The 40-foot high theater facade is blank except for four sets of slit windows on either side of the entrance which has a series of metal and glass doors set in a deep reveal with rounded walls. A perforated metal grid occupies the central part of the facade above the program sign over the entrance. The side elevations of the lobby block have recessed central panels with a grid of small rectangular windows.

10. **Type of ownership:** public
11. **Present use:** military base
12. **Zoning:** none
13. **Threats:** none

NAS ALAMEDA Building 18

HISTORICAL INFORMATION

14. Construction: 1941 and 1945 Original location: yes
15. Alterations: Minor alterations for 1980s theater remodeling: metal grill on facade
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION:

18. Theme: The development of U.S. Navy bases in the San Francisco Bay Area for World War II. Area: NAS Alameda Period: 1938-1945. Property type: District Context formally developed: yes

19. Context: Building 18 contributes to the NAS Alameda Historic District under Crite-rion A because it was constructed as an addition to the early core of buildings on the base. Under Criterion C, the building was designed in the cubistic, early Modern style of the rest of the early base buildings and, though it has been somewhat altered over time, it still retains a high degree of integrity and reinforces the streetscape on the E side of the landscaped quadrangle that stretches from the Main Building, 1, to the Main Gate.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

- Concrete surface.
- Flat roof.
- Quoin-like elements at corners and wall panels separating windows.
- Sweeping curved concrete surface at entrance.

3.5. Character-Defining Elements of Building 17.

Building 17 is one of the most dramatic structures within the historic district, nearly rivaling the Buildings 2, 3, and 4 complex for sheer size and structural complexity. Building 17, however, is a far different building architecturally, being the most frankly modern building in the historic district and containing virtually no neo-classical elements. Building 17 is also of interest for its lack of Streamline Moderne features. While it has some stacked vertical elements, it has no horizontal bands and very few curved elements, commonly found elsewhere in the historic district. The character of the building is defined by its rather austere modernity, mostly intact and unmodified. These character-defining elements include:

- "Stacked" concrete vertical elements at end of eastern and western wings.
- "Stacked" windows and concrete balconies at northern entry.
- "Stacked" glass block windows at sides of northern entry.
- Sympathetic two-over-two, double-hung aluminum windows.
- Some original five-light doors.
- Concrete canopy over rear loading dock; this is shown in **Photograph 32.**
- Curved concrete entry on north facade.

3.6. Character-Defining Elements of Building 18.

Building 18 functions as two buildings -- the theater and the post office -- and includes two structural elements that are very different from each other. There is a also a wood frame with stucco postal sorting area at the end of the post office; this appears to represent an early addition to the building, likely built during World War II. The only notable modification to the building was the installation of a metal screen at the front of the theater building, covering a characteristic set of stacked windows. Among the character-defining elements of this building are:

- Smooth concrete surface.
- Tall-two-story theater wing and low-slung post office wing.
- "Stacked" vertical element in theater wing (see Photograph 25).
- Arcade, including oval concrete columns, in post office wing (shown in Photograph 18).
- Original two-over-two wooden double-hung sash in mail sorting area of post office.
- Generally sympathetic aluminum two-over-two double-hung windows elsewhere.
- Characteristic curved entry to post office area.
- Characteristic concrete canopy at rear loading dock.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 24A is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 24A was constructed in 1977 to serve as an industrial waste treatment facility. It was one of the later additions to the industrial waste system established on base that was primarily constructed between 1970 and 1974. When Hangar 24 was constructed in 1990, Building 24A became the receiving center for the hangar's industrial waste. The building was potentially relocated from elsewhere on base to serve this purpose; it moved to its current location northeast of Hangar 24 between 1988 and 1993.[2]

Evaluation

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] Building 24A was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, Building 24A did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Building 24A was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 24A is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). It does not have a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while Building 24A served a function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). In addition to lack of historical significance, this building has been moved and, hence, its historic integrity has been diminished. Building 24-A does not possess historic significance and is not a contributing element of the NAS Alameda Historic District.

Building 25 houses the Corrosion Control Facility built in 1987 that encloses 54,450 square feet in a tall hangar type structure. The metal frame building sits on a concrete foundation and concrete block base wall approximately eight feet tall. The building is clad in corrugated metal. The north side is dominated by three pairs of sliding doors clad in metal. These doors are labeled east to west one through six numbering the bays. Doors 2, 4 and 5 have an inset metal personnel door. The east and west sides each has an exterior metal frame which taper at the bottom. The east side has a rollup overhead door and a pair of personnel doors cut into the concrete block base wall. The south side has two rectangular additions along the side. Each is approximately two thirds the height of the main building. (See Continuation Sheet.)

Building 25, the Corrosion Control Facility, is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***P3a. Description (cont.):**

These have personnel doors cut into the base wall as well as a set of exterior metal stairs leading to a single personnel door just above the base wall on the ends facing each other. The opposite ends have large vents. Along the south side two sets of overhead doors and personnel doors are cut into the base wall. Large ventilation equipment is on pads south of the building and connects via ductwork.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. This building is not eligible for listing in the NRHP or CRHR because it does not individually possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible. O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy.[1]

Building 25 was built in 1987 as a corrosion control building to bring three existing sand blasting and paint shops under one roof. Activities within the building included grit blasting/stripping, washing, and chemical stripping. A concrete trench system ran through the building to collect contaminated rinse water that was then routed through an underground tunnel to the waste cleaning system where the corrosives will be separated from the water at the industrial water treatment facility. From here the water would leave the industrial water treatment facility clean enough to be processed by the normal water system.[2]

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 27 was constructed in 1940 with a long rectangular footprint. This original layout included two tanks presumably associated with the building to the north. By 1949 this far northern section of the base was known as the Public Works Open Storage area and included Buildings 27, 28, 283, 299, 300, 301, and 302. The original eastward extension of Building 27 and associated tanks were removed between 1956 and 1958, leaving the current square footprint of the building. In 1956, when the building was used as a sewage disposal plant, Building 27 was one of three buildings on base to have a television camera mounted to its roof as part of a closed circuit system used to control aircraft traffic **(Photograph 3)**.[1]

Public Works, which ran Building 27, included seven divisions including Administration, Engineering, Maintenance Control, Housing, Maintenance, Utilities, and Transportation. The Public Works Department was in charge of the design, construction and maintenance of public works project and utilities. This included material handling equipment, aircraft support equipment and the public units within the East Bay Navy Family Housing Complex.
Building 27 fits into the broader Public Works department as a smaller maintenance shop, which at one point housed a compressor, and sewage disposal plant, and later served as a miscellaneous utility plant.[2]

Evaluation

Building 27 was part of the original period of construction on the station, and falls within the period of significance of the district: 1938-1945. Although Building 27 is associated with the district's significance under NRHP Criterion A (CRHR Criterion 1) for its contribution to the nation's defense during World War II, the alterations to the airfield prevent it from conveying its association with the World War II context. Furthermore, Building 27 lacks individual integrity and the utilitarian building style prevents Building 27 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the building was originally constructed during the period of

[1] "Map of U.S. Naval Air Station Alameda, Calif. Showing Conditions on June 30, 1949," Calif-Alameda-Pictures, Maps, Justifications, Record Group 5 Geographical File, CEC/Seabee Museum, Port Hueneme, California; "Map of U.S. Naval Air Station Alameda, Calif. Showing Conditions on June 30, 1944," Calif-Alameda-Pictures, Maps, Justifications, Record Group 5 Geographical File, CEC/Seabee Museum, Port Hueneme, California; "TV Used to Control NAS Aircraft Traffic," *The Carrier*, 2 March 1956.

[2] US Navy, *1971 Command History*, Command History 1971 folder, Box 2 of 2, 5757-1b, Naval Air Station Command History, 30 Volumes, 1968-1997, RG181, US Naval Shore Facilities, National Archives and Records Administration, Pacific Region, (San Francisco); Building 27, United States Navy, *Internet Naval Facilities Assets Data Store (iNFADS)*, 2008.

significance, many exterior and interior changes have been made since that time. Plus, the airfield has been reconfigured resulting in a loss of its association with the historic district. Building 27, therefore, does not convey its association with NAS Alameda operations during World War II, and is not a contributing element of the historic district.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[3]

In the larger context of the naval operations in California and nationwide during the Cold War, the Public Works / Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Though the building retains some integrity to its period of construction, it was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations during the Cold War. The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 29, located at the southwest corner of the Seaplane Lagoon, has a roughly T-shaped plan measuring 426 feet long and 135 feet wide totaling 19,480 square feet. The flat roof concrete building has multiple square and rectangular elements joined together with different roof heights **(Photograph 1)**. The building is described here by its sections, moving from north to south. The northern most two-story rectangular building section has parapet facades on the east and west sides. A metal personnel door is centrally located on the north wall **(Photograph 2)**. The east wall has a sliding door with a six light metal personnel door to the south partially covered by a metal shed roof canopy on the north side of the second building section **(Photograph 3)**. (See Continuation Sheet.)

The Gun Testing Facility (Building 29) is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

***P3a. Description (cont.):**

The one-story square section to the south has a double metal personnel door at the south end and two louvered vents on the south wall and large roof vents **(Photograph 4)**. Just south is a two-story rectangular building with a north-south orientation. It has a low-pitched gable roof with three groups of three louvered vents and metal ladder on the south wall second story. A long one-story and two-story north-south orientated rectangular section is joined to the south wall of the previous two-story section. Along the west side is a metal staircase that reaches the roof at the joint between the one and two-story sections **(Photograph 5)**. The two-story section on the south end has metal railings around the perimeter of the flat roof. To the south is a slanted roof that joins the last section of the building at the top of the corrugated metal door level **(Photograph 6)**. The one and two-story building has a corrugated metal overhead door with inset personnel door on the north end. The two-story center section has exterior equipment piped through the east side. The one-story south section is plain. An east-west oriented concrete wall with gable ends is located at the end of the building with an earthen mound behind **(Photograph 8)**. The west side of the building is plain except for a one-story section with a metal personnel door at the northern end and a sliding metal door and metal personnel door on the west side of the northern section of the building **(Photographs 9 through 12)**. The walls of the indoor firing tunnel at the south end of the building are 18-inch-thick concrete with a half-inch-thick plate of armor at the end of the tunnel. The building section at the end of the tunnel is constructed of 4 by 6-inch timbers with a half-inch armor plate and 18 inches of concrete with a sand berm to stop projectiles.[1]

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This building is not eligible for listing in the NRHP or CRHR because it does not individually possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible. O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy.[2]

DEPARTMENT OF PARKS AND RECREATION **HRI#**
CONTINUATION SHEET **Trinomial**

Page 4 **of** 10 ***Resource Name or #** (Assigned by recorder) Building 29

***Recorded by:** S. Miltenberger and H. Norby ***Date:** October 8, 2009 ☒ **Continuation** ☐ **Update**

Building 29 was constructed in 1989 for $3.4 million dollars as a self-contained center for disassembly, cleaning, non-destructive testing, plating, and re-assembling gun systems up to 30mm for aircraft and helicopter guns.[3] A computerized gun testing program, the Automated Data Acquisition System (ADAS) measured 26 ballistic and trajectory functions in the 364 foot long indoor firing tunnel that simulated firing distances of 2,000 meters.

The shop serviced the Navy fleet as well as the Department of Defense and Federal civilian agency customers. Previously, Alameda was the designated repair point for U.S. Navy and Marine Corp 20mm aircraft guns and specialized in surface attack boat guns, turrets, pods, and control circuit boards. The new shop specialized in helicopter gun turret repair and was the only Navy/Marine Corps depot performing this work.[4]

Evaluation

Building 29 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] In the larger context of the naval operations in California and nationwide during this period, the O&R function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it retains some integrity to when it was originally built, the building is not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 29 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

This form is an update to the previous recordation of this building in "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992 by Sally B. Woodbridge (see attached). The re-evaluation contained herein concludes that Building 35 is eligible for listing in the NRHP as a contributing element of the NAS Alameda Historic District. Its NRHP status code is 3D.

P1. Other Identifier: Radio Transmitter Building

P2 e. Other Locational Data: 2460 Pan Am Way on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 35 remains largely as described in the previous evaluation; however, some clarification is needed regarding its construction history. The northern portion of the building was constructed between 1939 and 1940 with an addition to the south end between 1942 and 1943.[1] Building 35 is a 2,761 square foot rectangular building on a concrete foundation. It is constructed of concrete and has a flat roof. There are two entrances on the west side of the building. The main entrance is near the north end and has Moderne-style details with a rounded Moderne-style cantilevered canopy, lettering, and concrete stairway with rounded balustrade. The door itself is wood frame with a boarded-up, full-length window, sidelights, and a fixed transom light **(Photograph 1 and 3)**. The second entrance is near the south end of the west façade and is plain by comparison to the main entrance **(Photograph 4)**. It has double metal doors with a single pane glazing, and a fixed transom light. Leading to the doors is a wood frame stairway and metal pipe railing. Windows on the building are two-over-two metal casement, placed singly and in pairs. The sets are divided by horizontally scored mullions that emulate the horizontal lines of the window panes, and which are similar to the mullions on other buildings built at the same time like the Bachelor Enlisted Quarters (Buildings 2 and 4). Near the top of the walls are evenly spaced, recessed squares that may have been openings at one time, but are now infilled **(Photograph 2)**. Pictures from the 1992 report show an antenna mounted on the roof of Building 35, which has since been removed.

B10. Significance:

This update form was prepared to provide additional information about Building 35, assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

Building 35, the NAS Alameda radio transmitter facility, was originally constructed by contractor Peter Sartoria of San Francisco in 1939-1940, during the original phase of development of the station. A large addition was constructed at the south end of the building in 1942-1943 (see **Photograph 5**, **Photograph 6**, and **Photograph 7**, as well as maps from 1942 and 1944 below). Station communications contributed to operations providing radio and other communication links with Navy aircraft and ships, civilian facilities and operators, and other military stations and the military establishment. These communications operated through system of facilities on NAS Alameda located in Building 1 (Administration), Building 19 (Control Tower), Building 35 (Radio Transmitter), and Building 133 (Radio Receiver). From when it was constructed through the 1950s, Building 35 was the station's primary radio transmitter facility, operating with outlying antennas.[2] The building's uses changed during the 1950s and 1960s. By the 1970s, the Ground Electronics Maintenance Division (GEMD) headquarters was stationed in the building. The building was occupied by the Naval Telecommunications Center beginning in 1977.[3]

Building 35 played a minor role in the Walker Family Spy ring led by John Walker Jr. A secondary figure in the ring, Jerry Whitworth, worked out of the building between 1979 and 1981. This period represents the end of the spy ring which operated between 1967 and 1985. Whitworth removed secure cryptographic information from the building, photographed it, and passed it along to Walker. Walker in turn passed the information to Soviet KGB agents in the Norfolk, Virginia area. Building 35 is one of several secure locations from which the spy ring procured information. While their activities represent one of the notorious espionage episodes of the Cold War, it is a story not strongly associated with any specific location. The ring collected information from several sources, and traded it at a variety of locations.[4]

The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country during the mid to late 1930s. During World War II, NAS Alameda was effectively adapted to support naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to serve and support its important wartime activities. NAS Alameda was one of three major air stations on the west coast to support operations of aircraft carrier groups, patrol squadrons, and utility squadrons, and it conducted crucial functions for aircraft assembly and repair (A&R). Following naval aviation's successes in

World War II, the Navy established the aircraft carrier as a central basis for naval operations, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. While it conducted vital functions, NAS Alameda played a support role that was part of the Navy's standard operations during this period and thus the station did not play an important direct role in the historically significant themes of Cold War naval missions and activities.

The Navy acquired much of the property that became NAS Alameda in 1936. All of the more than 2,000 acres of the acquisition was submerged or was fill. Congress appropriated funding for the construction of a facility at Alameda to support naval aviation in 1937, but time was needed to move previous facilities from the property, include commercial operations from Alameda Municipal Airport and the Army facilities, thus delaying commencement of construction for the new naval air station.[5] Meanwhile, as military tension around the world increased, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur J. Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. Its work, set forth in the Hepburn Report of 1938, directed Navy expansion. Among its recommendations was the establishment of major air stations with the ability to assemble and maintain aircraft, along with management of regular operations. The Hepburn Board boosted the status of the new navy property in Alameda by recommending establishment of NAS Alameda as a one of the major air stations on the west coast supporting both operations and aircraft A&R. The plan called for NAS Alameda to support two carrier groups (with possible expansion to four carrier groups) and five patrol squadrons, along with functions to perform aircraft overhaul.[6]

NAS Alameda was one of six major naval air stations that the Hepburn Board recommended for construction. The other stations included NAS Norfolk (Virginia), NAS San Diego (North Island), and NAS Seattle (Sand Point), which were already in use for naval aviation activities, and were expanded in response to the Hepburn Report. NAS Alameda, along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program, although Congress had already approved funding for NAS Alameda. The design and construction of NAS Alameda occurred at the same time as NAS Jacksonville and NAS Quonset Point. The assertive conclusion of the Hepburn Report was that need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning.[7]

The Navy's Bureau of Yards and Docks (BuDocks), Department of Planning and Design, designed the station with civilian architects, engineers, and planners. In general, plans for the station's design followed hierarchal and organizational planning doctrines used for military bases and naval air facilities of the period and that had evolved during the early twentieth century. Plans for NAS Alameda – drafted during peacetime – envisioned a 1,000-personnel facility that would house 200 aircraft and serve as home port for two aircraft carriers. The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[12] The station's original design received an award for functional planning at the Seventh Annual Architectural Exhibition of the Association of Federal Architects in Washington D.C. in 1939.[13] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. BuDocks and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed

Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[13] US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco).

each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. Following the Hepburn Report, BuDocks and BuAer further refined standards and requirements for naval air stations. However, local conditions necessitated alterations for improved functionality at given locations.[14] NAS Alameda followed many of the standards and requirements of the period. Yet, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report.

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period planners located piers, seaplanes functions, landplanes services, industrial facilities, storage, administration, communications facilities, and personnel activities, in an orderly fashion so that work could flow smoothly. As a result of this organization, naval air stations designed and built in this period share similar organization.[15]

Early plans for NAS Alameda show a station arranged along intersecting axes and divided into functional areas, although without details that would emerge during the station's early years. In the early plans from 1939 the north-south axis ran from the main gate bisecting the mall and the Administration Building (Building 1) with an east-west axis dividing the administrative / residential area on the north side of the station with the industrial and operations on the south side. This east-west axis was originally to be an open area that was to align with the middle of the airfield on the west end of the station, with landplane hangars flanking this axis, and Building 35 on the east end. There was also another east-west axis in the original plan that bisected the Bachelor Enlisted Quarters (BEQ) area (Buildings 2, 3, and 4) and crossing the north-south axis in the middle of the mall in front of Building 1 and along the median of what is now West Essex Drive. The BEQs with their Galley / Mess Hall (Buildings 2, 3, and 4) were shown in their current location. Bachelor Officers Quarters (now Building 17) were to be two mirrored buildings facing a central green space similar to that of the enlisted quadrangle. Officers' family housing was the only non-axial portion of the station, planed as an irregular loop in the northeast corner. The original A&R facility (Building 5) was planned at half its eventual size and the location of several functions were not yet assigned, such as much of the recreation facilities and some of the residences. Functional and departmental requirements led to specific siting of some facilities and changes in the station's design and plans during the planned phased construction of the new station, including abandonment of the open area east-west axis as the landplane hangars were repositioned parallel to the airfield and additional space was needed for important buildings so they could be situated near industrial and storage facilities. The axis from the BEQ quadrangle across the mall stretching to the officers housing area thus received prominence. Despite these changes, the evolution of the station's layout during both the initial years of construction prior to US entry into World War II and during the war left intact much of the station's original planning and its important principles of organization, functionality, and efficiency, adapting well to the enormous demands of war. The initial plans for a 1,000 personnel facility evolved during the war to 18,000 Navy personnel and 9,000 civilians working on the station.[16]

Construction of the new air station began in February 1938 with much of the initial work focused on filling and grading new land, as well as forming the Seaplane Lagoon. The Navy phased construction of buildings at the station. Individual barracks, mess halls, and operational buildings were constructed in increments, with planned expansions. The beginning of hostilities in Western Europe in September 1939 stimulated the Navy to quicken the pace of construction on NAS Alameda. In July 1940, a month after Germany invaded France, Belgium, and the Netherlands, Congress approved an additional $17 million for work on NAS Alameda. Johnson, Drake & Piper Construction Company was awarded the major contract to hasten the station's completion.[17] As noted above, the Navy altered the original 1939 plans as construction progressed. Plans for the land plane hangars (Buildings 20, 21, 22 and 23, constructed 1941) shifted them from facing the east-west axis to a row along the western edge of the station, facing the airfield. It was during this period that the decision had been made to not proceed with the station's initial open area east-west axis and to use that space for necessary buildings, including the Weapons Shop (Building 43), and to emphasize the east-west axis across the BEQ quadrangle and the Administrative Building's mall. The Navy commissioned NAS Alameda in November 1940.

In addition to the careful master planning for the station following principles of organization, functionality, hierarchy, and efficiency, the Navy also designed prominent buildings on the station in a manner that corresponded with the efforts to create a modern and organized facility. This was achieved by adhering the station's plan to a Beaux Arts formal spatial layout and by designing most of its prominent buildings in the Moderne style, which blended neo-classical proportion, symmetry, and order with modern design concepts of the time.[18] The planning and architecture on NAS Alameda demonstrate trends which BuDocks designers drew upon related to campus planning, modernistic design, and the continued traditional architectural expressions of federal buildings during this period. The NAS Alameda station plan had a comprehensive aesthetic design based on the Beaux Art planning used in City Beautiful planning. The City Beautiful movement heavily influenced planning in the United States in the first half of the twentieth century, and can be seen in city planning as well as institutional settings such as college campuses. The movement borrowed planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, such as those employed on NAS Alameda. Various *partis* or shapes, such as courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. In many nineteenth century and early twentieth century examples of such plan, the buildings were also in the Beaux Arts style with Classically-derived ornamentation, but as styles evolved, buildings constructed on such plans were of a variety of styles, including the developing Moderne style used on NAS Alameda. The US

[18] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

military had employed Beaux Arts inspired plans since World War I and continued to use such plans throughout the period between the two wars.[19]

At the same time, Beaux Art and City Beautiful planning remained popular and prominent in civic and military design, architects worldwide began to abandon historical revival styles during the late 1920s and especially during the 1930s in favor of designs that consciously illustrated modernity and technological progress using simplified geometric forms and ornamentation. This trend developed mostly from European modernistic art and industrial design, but transferred to architecture wherein it presented sleek and spare designs. Often buildings designed in the new style(s) of the period retained proportion, symmetry, and order found in buildings inspired by Classical architecture, but without direct allusion to historical styles. Materials such as concrete, metals, and glass block – all of which were used on NAS Alameda – were prominently used to illustrate a directness regarding building fabric to help portray the machine / technological-inspired aesthetic. The rapid evolution of aviation and other forms of transportation during the 1920s and 1930s particularly inspired designers to illustrate in architecture and industrial design modern society's departure from the past that was seemed apparent, or was being sought, at the time. The expansion of civilian and military aviation was symbolic of modern technological achievement and streamline forms appeared in and influenced the design of seaplane and landplane aircraft as well as in the buildings of the growing nationwide network of civilian airports.

Of the "modern" architectural styles of the 1930s, Moderne (also referred to as Art Moderne or Streamline Moderne) that was less ornamental than Art Deco. It expressed modernity by using curving wall surfaces and columns with highlighted simplified geometric ornamentation such as the wall panel striations, like the mullions on Building 35, and stylized Pegasus and eagle figures in the BEQ area (Buildings 2, 3, and 4).[20] Architects working on Federal contracts during the 1930s developed a "style" that sought to maintain form, symmetry, and organization of the classical traditions that had guided Federal design since the early years of the Republic, but which drew upon the evolving modern styles of the decade that were increasingly popular in private construction. Various architectural historians have attempted to develop a specific name for this style, including "Starved Classicism" and "PWA Moderne." The latter of these terms denotes the use of the style for buildings constructed from the Public Works Administration program.[21] This is the style of the NAS Alameda Historic District, particularly in the Administrative Core area. The style is found throughout California, particularly in the dozens of post offices built during the 1930s. The style was rarely used, however, in the design of military buildings. NAS Alameda is only one of three military facilities in California designed in the Moderne style.[22]

The demands on naval aviation during World War II transformed NAS Alameda dramatically, requiring the new station to adapt to increased demands and an expansion its capability. This resulted in additions to and alterations of the station's original design. In the course of the war the station became the homeport to 23 ships, 22 air squadrons, and 1,500 aircraft. Air traffic on NAS Alameda increased, resulting in creation of auxiliary and outlying fields elsewhere in northern California and in Nevada to handle excess air traffic. This likely placed enormous demands on the communications system on station during the war. NAS Alameda had a three-fold mission: assembly and repair of aircraft; supply; and aircraft operation and training. The radio transmission facility in Building 35 contributed to the communications system for the station operations, most importantly related to aircraft and ship operations. Alterations to Building 35 during wartime included an extension to Building 35 begun in 1943 and completed by 1945. War time demands further increased the need to construct buildings in the proposed wide east-west axis originally intended as open space separating the administrative and residential areas from industrial operations areas. Initial construction in the axial area was small, consisting of two engineering buildings (Buildings 42 and 44) and a small weapons shop (Building 43) at the west end. Construction continued in the area with the civilian cafeteria (Building 62) in 1942, Ground Training Building (Building 101) in 1942, Ordinance Office (Building 102) in 1943, Public Works Shop (Building 114) in 1944, and Storage Racks (Building 191) in 1944.[23] The last portion of this axis to be filled was the northern expansion of Building 5, the Interim Overhaul Building, in 1945, which was usually referred to as Building 5A. This addition had not been included in the original station plans and nearly doubled the size of Building 5.[24]

Throughout the war years, NAS Alameda served a valuable role in naval operations and demonstrated the critical role aviation had within Navy strategy and operations, including the station's communications system. Swarms of Navy and civilian personnel carried on activities aimed at providing support services to the striking arm of the fleet. Its training facilities prepared service personnel for duties in forward areas, and air crews in flight operations. Its shops and repair facilities assembled aircraft and returned battle-damaged aircraft to the fight. It provided a homeport for combat ships, and a resupply and service location for their crews and equipment. In all of this NAS Alameda was like the many naval facilities around San Francisco Bay, along the Pacific Coast, and along the Atlantic seaboard – it helped keep the Navy fighting.[25]

As noted above, the Navy established the aircraft carrier as a central basis for naval operations following its successes in World War II, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. NAS Alameda supported carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, and continued to carry out its main function of aircraft overhaul and repair. Much of the focus for military development during the Cold War, however, was on research and development of innovative aircraft and weapons. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of Cold War naval missions and activities. Through the early Cold

[23] Buildings 42,43,44,62,101,102,114,191,United States Navy, *NAS Alameda Internet Naval Facilities Assets Data Store (iNFADS)*, 2008; Bureau of Yards and Docks, "US Naval Air Station Alameda, General Aircraft Paint and Oil Storehouses and Power Plant Building General Location Plan and Detail Plot Plan," Yards and Docks # 133376, October 1939, Drawer 4200, Base Development Maps, Plan and Maps Room, Building 1 on former NAS Alameda, Alameda, California; Jones and Stokes, "Historic Properties Inspection Report for the Naval Air Station Alameda Historic District Alameda, California, Final" (prepared for Naval Facilities Engineering Command, Southwest and Base Realignment and Closure Program Management Office West, July 2007), 6-73.

[25] Allbrandt, "History of the Naval Air Station & Naval Aviation Depot;" Naval Air Station Alameda, *U.S. Naval Air Station Alameda, California* (Baton Rouge, LA: Army and Navy Publishing Company of Louisiana, 1945), np

War, NAS Alameda and other air stations adapted to service new technologies and equipment developed elsewhere by adding facilities to accommodate and maintain jet aircraft and other conventional weapons. However, technology outpaced the station's development. The expansion of San Francisco Bay Area urban development, expense of maintaining facilities, and reorganization of Naval shore establishments with changing missions and military requirements led to the eventual decommissioning of the station after the Cold War ended.[26]

The historical record for NAS Alameda does not provide details about the changing uses of Building 35 after World War II. Communications technologies evolved and shifted during this period, which altered how the Navy used Building 35. As noted above, the Ground Electronics Maintenance Division (GEMD) headquarters was stationed in the building by the 1970s. Duties of the division included maintaining FM mobile communications for Base Security and Industrial Control Net, as well as the station backup emergency control center. As the division's name suggests, the Building 35 took on a more supportive role in station communications and does not appear to have continued to function directly with operations as it had during World War II. The building was then occupied by the Naval Telecommunications Center, which operated and maintained the station's telephone system, beginning in 1977.[27]

Evaluation

In terms of Building 35's place within the existing NAS Alameda Historic District, this evaluation concludes that it is a contributing resource because of its shared association with other contributors to that district's significance under Criterion A and under Criterion C. The original district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[28]

The buildings considered non-contributors were those within the district that were either built outside the period of significance (i.e., post 1945), or were built within the period of significance and had lost integrity through alteration. Building 35 was placed in the latter category because Woodbridge thought it to have been substantially altered in 1960.[29] The division between the original construction and the addition is clear to the visible eye, and the southern end has little architectural style to assist in dating the addition. Woodbridge had limited access to files held by the

[26] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000); Allbrandt, "History of the Naval Air Station & Naval Aviation Depot at Alameda, California."

[27] US Navy, *Naval Air Station, Alameda, Command History 1978*, Unlabeled Folder contains 1978 and 1979 Command Histories, Box 2 of 2, 5757-1b, NAS Command History, 30 Volumes, 1968-1997, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco); US Navy, 1979 NAS Alameda Base Directory, Box 2 of 22, 5757-1b, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco), 38.

[28] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," 1992. 1-2, 11-12.

[29] Woodbridge, "Historic Architectural Resources Inventory," inventory form for Building 35.

Facilities Management Office. These files included limited alteration dates and little to no information regarding the nature of the alterations. Research undertaken for this project in building plans, records, and aerial photographs indicates, however, that the expansion of the building occurred by 1943, completely within the period of significance, with relatively few exterior changes to the building since that time.[30] The contract files held at the CEC/Seabee Museum in Port Hueneme include an addendum for an extension to Building 35 issued in 1943. The 1945 *Public Works of the Navy Data Book* documents that the addition was completed by 1945. The extension is also evident on station mapping and in aerial photographs, such as **Photograph 7**. Building 35 generally retains sufficient historic integrity to the historic district's period of significance. The removal of an antenna located on the roof of the building in pictures from 1992, does not sufficiently diminish the significance of the building since communication equipment requires replacement over time with advancements in technology. The original communication system was a group of three antennae in a triangular formation around the building (**Figures 1** and **2**), and the antenna mounted on the roof of the building did not appear to date to this system during the historic district's period of significance. Furthermore, the use of Building 35 no longer was part of an essential component of the communication system and took a more supportive role housing headquarters for communication personnel to maintain the communication system throughout the station.

Building 35 is a contributor to the NAS Alameda Historic District, which is significant at the state level under NRHP Criterion A and NRHP Criterion C. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development during the period of significance 1938-1945. Building 35 is significant for its association with the historic district's importance in naval air station development in the 1930s, the role NAS Alameda served during World War II, and its architecture. In addition to its historical significance, Building 35 also retains sufficient historic integrity to convey its significance to the historic district's period of significance.

Under Criterion A, Building 35 is a contributor to the NAS Alameda Historic District because of its important role within station operations as part of the communication system and its association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the station's role in Pacific theater naval operations during World War II. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention to the design and construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts in the design and layout of the station to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and successfully adapted by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. Building 35, including its war time expansion, provides a direct link to NAS Alameda's initial development and its support of a central and vital role in the Pacific theater during World War II.

Under Criterion C, Building 35 is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and

[30] Department of the Navy Bureau of Yards and Docks, *Public Works of the Navy Data Book: Buildings*, July 1945, 826, Box 232, RG 8, CEC/ Seabee Museum, Port Hueneme.

organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation.

Building 35, located prominently in the early station layout, demonstrates the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period following distinct organizational and hierarchal designs, showing the magnitude the Navy placed on the design to illustrate the modernity and importance of the naval aviation strategy for the Pacific Fleet. It helps illustrate the evolution of the station's design, initial development, and adaptation during the war. Refined details in the Moderne style including quoin like elements between windows, curving stair, and curved doorway hood further support the importance placed on the design. Completion of the station plan was sped up and then successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional design enabled the station to rapidly expand to serve and support this important wartime activity.

The historic district, and its contributors including Building 35, does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

Building 35 is significant as a contributor to the historic district and it retains sufficient historic integrity to convey that significance. It has the physical features that relate to its significance, and it retains elements of all aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

Building 35 has similar character-defining features as other buildings in the administrative core on station, as identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[31] Character-defining features of the building include its smooth concrete surface, flat roof, and horizontal emphasis created by other character-defining features. These other character-defining features include the two over two windows, the horizontally scored mullions between the windows, curved concrete canopy, curved edges to the entry steps, and curved walls flanking the entry. The building has one character-defining feature that is unique within the historic district: the square recesses above the windows. No interior character-defining features were identified for Building 35.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[32] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure at NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Although Building 35 may have been the site of some activities of a participant in the Walker

Family Spy Ring, Building 35 itself was not an important factor in the spying activity, and research did not reveal that building had a direct or important role in this notorious historical event. Building 35, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). It played a supporting role in the operations of the station, and while it served this function on NAS Alameda during the Cold War era, it did not play a significant role in their research, design, testing and evaluation, functions that might have imbued it with significance within context of the Cold War.

Although Building 35 does not possess Cold War-era significance, this building meets the criteria for listing on the NRHP as a contributing element of the NAS Alameda Historic District (NRHP Status Code 3D).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION
1. &2. Historic/Current name: Building 35, Maintenance shop.
3. Location: NAS Alameda Map M-27 City: Alameda Zip: 94501
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DISCRIPTION
6. Propterty category: District Number of resources documented: 85
7. Existing condition: a one-story, concrete building, 75 ft. long and 35 ft. wide, with a flat roof, a raised base, and a rectangular plan. The original, north part of the building has an entrance with double wood doors reached by a concrete platform with 5 steps. A concrete canopy with rounded corners projects from the wall above the doors. Four small, square windows on each elevation vent the attic; typical windows are paired and metal-framed with 4-light hopper sash. Four such windows occur on the main facade and are visually connected by scored lines in the walls between them. The S end of the building, a later addition, has an entrance door with a short flight of metal steps, but the rest of the walls are blank.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. Building 36A is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The tower did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Although Navy building records from 2008 indicate Building 36A was built in 1940, it is clear from field observation that the current tower is not the original and is of recent construction. The original communications tower was constructed in 1940 by the Pittsburg Desmoines Steel Company and was a 150 foot tall tower of triangular construction with three steel legs which were 25 feet apart at the base. The original tower also included safety guard ladders, fixed red lights, and a 9'4" x 3'5" platform at the top of the tower. The original tower was demolished at an unknown date and the date of construction of the current tower is also unknown.[2]

Evaluation

Building 36A was built after World War II operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically

significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, Building 36A did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Building 36A was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 36A is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). Building 36A does not have a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Fuel Chemical Lab and Office / Engineering Facility

P2 e. Other Locational Data: 2480 Monarch Street; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete foundation, Building 42 has a rectangular plan covering 2,969 square feet, and is constructed of plywood formed concrete with a flat roof. The main entrance on the west side faces Monarch Street and has a cantilevered concrete porch canopy with rounded Moderne style corners (**Photograph 1 and 2**). Concrete stairs with metal hand railings lead to a porch with two sets of doors. A metal double door accesses the main building and a single personnel door leads to a partially enclosed porch on the south end (**Photograph 3**). The other main entry point to the building is accessed from a concrete ramp/stairs that wraps around the southeast corner and leads to a single personnel door cut into a large multi-pane window on the east side (**Photograph 4**). The north and south sides of the building have identical, centered multi-pane windows, covered with grates. A metal, caged access ladder is affixed to the northwest corner (**Photograph 5**). Copper downspouts remain attached to the building, one on the south side, and two on the north.

B10. Significance:

This update form was prepared to provide additional information about Building 42, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Johnson, Drake and Piper constructed Building 42 in 1941 as an Inert Materials Storehouse under the same project that constructed eleven other ordnance facilities at the Station. The building appears to be built from the "Standard Magazine Building: Naval Ammunition Depots" plan, originally drafted in 1918. The plan is for one-story, aboveground buildings with 12-inch thick, terra-cotta walls. As built the main entrance on the west side had two sets of double doors accessed by a raised concrete platform. In 1943 a shed roof addition, no longer present, was added to the south side (**Photograph 6**). Modifications to the entry that added the partially enclosed porch were made sometime after 1958.[3]

[2] Building 42- Chemical Lab photo, "O & R Buildings Data Book No. 2", Box 12 of 22, 3195-C, NAS Alameda, General Records, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).

In the early 1950s the Navy primarily used Building 42 as a storage warehouse. In the late 1950s the use of the building changed to a fuel chemical lab and other operations including aircraft maintenance and administrative offices. Between 1963 and 1968 the building was transferred over to Naval Air Rework Facility (NARF) operations for the same uses. In 1974 the building was used solely as a materials lab by NARF.[4]

Evaluation

Building 42 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[5] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[6] These are detailed on the attached sheets, and include smooth building surface, steel industrial sash windows, and curved concrete entry canopy.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] NAS

Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 42, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or

trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 42 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

***B14. Evaluator:** M. Bunse and H. Norby

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.& 2. Historic/Current name: Building 42, Fuel Chemical Lab and Office
3. Street: First St. **NAS Alameda Map** M-20 City: Alameda Zip: 94501
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a one-story, concrete building, 61 ft. long by 48 ft. wide and 17 ft. high, with a parapeted roof and a rectangular plan. A loading dock with a flight of steps on each end and a metal railing extends across the facade. A section of wall with a large opening supports a flat roof, rounded on one end, that is cantilevered from the wall below the roof line. Double metal doors open off the loading dock. Typical windows have metal frames and multiple-light, hopper sash.

HISTORICAL INFORMATION

14. Construction date: 1941. Original location: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context fully
developed: yes

19. Context: Building 42 contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1941 as part of the early central core of buildings on the base which stills conveys the impression of the air station during the period of significance. Under Criterion C, the building was designed in the simplified Modern style that characterizes the permanent buildings on the base from this period.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

***Recorded by:** S. Miltenberger and H. Norby ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 43 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Weapons Shop

P2 e. Other Locational Data: 2440 Monarch Street; on former Naval Air Station Alameda

***P3a. Description:** **(Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)**

Building 43 is a two and one half story building with a rectangular plan, an L-shaped clerestory, and two small additions to the north side covering 10,500 square feet. The main entrance faces Monarch Street and consists of a centered metal roll-up door flanked by large multi-pane windows with a band of awnings. The windows have been covered with a metal grate, one of which has metal awnings to allow the awning windows to function. A four-light wooden personnel door is installed in the window on the north side of the roll-up door. On this end the clerestory is centered above the lower level, giving the building the appearance of having north-south wings. This part of the clerestory is fenestrated with a band of twelve-pane windows with awnings (**Photograph 1**).

A small concrete box addition with a flat roof sits on the second story of the north side of the building (**Photograph 1**). Fenestration on the north side includes multi-pane windows with awnings, and six over six double hung windows, many of which have grates installed (**Photograph 2**). The clerestory is fenestrated with six over three awning windows. Personnel access on this side is through an upstairs door at the east end, accessed by metal stairs (**Photograph 3**). The first story has three groups of two-over-three double-hung windows with venting added to the western end. A small corrugated metal lean-to addition with a shed roof is attached on the east end.

The east side of the building has two levels because of the placement of the L-shaped clerestory (**Photograph 4**). A metal roll-up door is centered on this end and flanked on the north by six over three double hung windows and six over six double hung windows, and a multi-pane window with awnings to the south. The clerestory has a band of six, twelve-pane awning windows. An electrical transformer is located at the southeast corner (**Photograph 4**).

The clerestory runs the length of the south side of the building and is fenestrated with a band of six, six over three awning windows. Three large window openings on the west end of the ground-level have been permanently filled with concrete blocks (**Photograph 5**). The remaining windows are large multi-pane windows with awnings on the east end. A metal access ladder is attached to the southeast end.

B10. Significance:

This update form was prepared to provide additional information about Building 43, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Johnson, Drake and Piper constructed Building 43 as a permanent building in 1941 to serve as part of the Weapons Department. An addition was made to the east end of the clerestory in 1942- 43 (**Photographs 4** and **6**). The building was used for torpedo storage in the 1940s and 1950s and used as a weapons shop in the 1960s and for storage and ammunition rework and overhaul in the 1970s.[2]

The mission of the Weapons Department in the late 1960s was to procure, receipt, storage, maintenance, and issue of all weapons, ammunition, and explosives authorized by the Station for support of fleet units and tenant activities, to operate small arms firing ranges, provide special augmenting units for performances of test, repair, maintenance, overhaul or assembly of weapons. The Weapons Department also provided serviced for weapons shipment, explosive ordnance, special weapons disposal, and special weapons loading of A4, A6, and A7-type aircraft.[3]

Evaluation

Building 43 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with

a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[5] These are detailed on the attached sheets, and include smooth building surface, and steel industrial sash windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 43, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 43 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Weapons Building 43
3. Street: First St. **NAS Alameda MAP** M-20 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM zone: Oakland West, CA, A B C D
5. Quad map No.: 3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District. No. of documented resources: 85
7. Existing condition: a concrete building with a rectangular plan and a two-story, central section flanked by one-story wings. The central entrance door is located on one side of a high rectangular opening that has both metal and glazed sections. Above the entrance is a bank of 6 windows with metal mullions and sash with 12 lights. The south wing has a bank of 4 windows of the same type as those above the entrance; The north wing has similar metal windows, but a secondary door is set into one of the windows. The side elevations have metal hopper windows on the upper story.

HISTORICAL INFORMATION

14. Construction date: 1941 Original location: same.
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District Context formally developed: yes.

19. Context: Building 43 contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1941 in the core area of the naval air station. Under Criterion C, the building is representative of the early Modern style of the permanent class of concrete structures that were designed for the base.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990
24. Survey type: visual inspection
25. Survey name: Section 110 (A)(2)

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 44

***Recorded by:** C. Brookshear and S. Miltenberger ***Date:** October 1, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 44 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Engineering Office Facility

P2 e. Other Locational Data: 2400 Monarch Street; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete foundation, Building 44 is a one-story concrete building measuring 5,073 square feet with an irregular square plan with an attached rectangular addition on the northeast corner. Both sections have a flat roof and are constructed of panel formed concrete but the square section has a raised water table base. The west façade has a centrally located entrance with a pair of metal personnel doors with single panes of glass with a pair of three-over-three fixed metal window above the door. A group of four ten-over-five fixed metal windows on the north side and a group of four five-over-three windows on the south side flank the main entrance on the west facade (**Photograph 1**).

The south side of the building has a group of four five-over-three fixed metal windows and a centrally located metal personnel door with a metal ramp. The set back east façade has a pair of central double metal personnel doors with single panes of glass and a raised concrete landing. Fenestration includes a pair of three-over-two fixed metal windows above the entrance and a four-over-three window on the west side (**Photograph 2**).

The set back east side has a pair of metal four light personnel double doors with a pair of four-over-three fixed metal windows above. The entrance is flanked by a pair of two groups of five-over-three fixed pane windows. The north side of the east façade has two groups of fixed pane metal windows composed of two middle sections of four-over-four flanked by a group of three-over-three windows (**Photograph 3**).

The north side facing Building 43 has a metal personnel door at the northeast corner with a three-over-four fixed metal window. Fenestration on the set back north façade of the west section has a two-part sliding aluminum window with a group of five ten-over-six fixed metal windows that have been painted over. An exterior ladder is located on the east side of the fixed window group and external electrical equipment on the south end. Fenestration on the set back west façade on the north side has a three-part fixed pane metal window composed of two three-over-three windows flanking a four-over-four window, and a four-over-five window on the south (**Photograph 4**).

B10. Significance (cont.):

This update form was prepared to provide additional information about Building 44, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Johnson, Drake, and Piper constructed the first phase of Building 44 in 1941 as the facilities for overhaul and repair of bombsights during World War II. Two additions were constructed in 1944 adjacent to the original rectangular building, facing west at the northeast corner of the building. In 1957 the building was expanded from the rear of the west section by contractor Herbert Ellis for a tensile testing machine and altitude test chambers. The activity was segregated from the main Overhaul and Repair building (Building 5) for radar overhaul to more easily maintain the security of the bombsight mechanism which was so necessary in the early days of the war. [3]

In the late 1950s the building was used as a materials laboratory for the Overhaul and Repair Department under materials and processing. The building was used as an aeronautical lab in the early 1960s and was used for aircraft maintenance in the late 1960s and early 1970s. Beginning in1974 it was used as a materials laboratory. [4]

Evaluation

Building 44 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[5] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character

defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[6] These are detailed on the attached sheets, and include smooth building surface, and steel industrial sash windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 44, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 44 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.& 2. Historic/Current name: Building 44
3. Location: NAS Alameda Map N-20 City: ALAMEDA Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a one-story, concrete building, 41 ft. by 61 ft., with a flat roof and a hyphenated, two-part, rectangular plan. The walls have large expanses of 4-part, fixed, metal sash with metal mullions as well as metal hopper sash. Entrance doors are wood and metal. Exterior ducts and other equipment is in fenced yards behind the building.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none

NAS ALAMEDA Building 60

HISTORICAL INFORMATION

14. Construction date: 1941
15. Aterations: none visible

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Building 44 contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1941 as part of the central core of building on the base. Under Criterion C, the building is representative of the type of permanent concrete structure in a simplified Modern style that is common on the base; it appears unaltered and is in good condition.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R).

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. However, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities, during the Cold War era.

Individual buildings constructed during World War II and used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. This building is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

In September 1941 Alameda submitted a bulk funding request that included $37,500 for two smoke drum storehouses. Building 53 was constructed by Johnson Drake and Piper in 1941 at a cost of $20,600 to store inert materials. The building was relocated in 1951 or 1952 during then expansion of the runways (**Photograph 3**). As of September 1997 there was no live ammunition stored here.[1]

Evaluation

Because of the standardization and ubiquity of magazines on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This

[1] US Navy, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," October 2006, A1.1; Building 53, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme.[2] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, California Historic Military Buildings and Structures Inventory, prepared for USACE (2000).

program comment applies to ammunition storage facilities that are not a part of a historic district. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research

Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Although Building 53 is associated with the district's significance under NRHP Criterion A (CRHR Criterion 1) for its contribution to the nation's defense during World War II, the alterations to the airfield prevent it from conveying its association with the World War II context. Furthermore, Building 53 lacks individual integrity and the utilitarian building style prevents Building 53 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). Building 53 has lost integrity due to its relocation during the expansion of the airfield on NAS Alameda in the early 1950s, and does not meet the threshold for eligibility under Criteria Consideration B for moved properties. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

This smoke drum storehouse was built during World War II operations on NAS Alameda, and was part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, the magazine and ordnance handling function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structures on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 53's was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general (NRHP Criterion A / CRHR Criterion 1). This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the building was moved between 1951 and 1952, affecting its integrity of

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Officer's Club

P2 e. Other Locational Data: 641 West Red Line Avenue; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Officer's Club, Building 60, is a 29,538 square foot concrete-formed building with a multi-level flat parapet roof with an irregular rectangular floor plan and wing extension on the west side. The main entrance is on the south side of the building. Although the parking lot for the building is sited on the north side of the building, the vehicle entrance is on the southeast side of the building with a driveway wrapping around the east side to the parking lot. This driveway passes by utilitarian service areas of the building before feeding into the parking lot. The north side of the building has a designed garden courtyard with an offset open-air kitchen (Building 419) featuring a large barbeque pit.

On the north side of the building a semicircular section extends from the otherwise linear footprint, and a covered walkway leads to the main entrance. Concrete planters follow the curvilinear lines of the semicircular section reflecting the Moderne style of architecture used throughout the station's administrative core (**Photograph 1**). The walkway approaching the main entrance on the south side is covered by a metal framed awning supported by square metal poles with wooden cross-beams. Concrete planters flank the entrance to the walkway which is composed of exposed aggregate squares separated by wooden strips with decorative brick patterns. A concrete ramp with metal handrails is installed east of the walkway. The walkway terminates at a set of concrete stairs leading up to the recessed entry porch, supported by plain concrete columns (**Photograph 2**). Full-length windows flank a decoratively carved large wooden double-door. West of the main entrance, heavy landscaping partially obscures a single fixed aluminum-framed window followed by a ribbon of aluminum-framed louvered windows with metal flanges set high on the wall (**Photograph 3**). These windows are in pairs and split by a concrete block detail. On the same wing, east of the louvered windows a raised metal louvered door is followed by three sets of metal-framed windows. Each window has a stacked set of five horizontal lights, two on the top, and two on the bottom, with one hopper window in the middle. There is a short decorative concrete wall and planter in the front of these three windows.

The 'L' shaped east side of the building is the commercial delivery area and fenestration and landscaping is more modest than the other areas of the building. Instead of full length windows and entryways with accentuated approaches, this area features rows of metal-framed windows, some boarded over. Sliding doors and metal personnel doors with small, concrete stair approaches service this area. A shed roof overhang creates a narrow patio the length of the set-back on the east side of the building. This overhang also shelters a raised concrete loading dock (**Photograph 4**). A corrugated metal shed with a flat roof sits in this area north of the easternmost part of the building (**Photograph 5**).

The northernmost portion of the building has a secondary entrance, recessed with deep overhanging roof, lower than the building roof line, supported by 'V' poles that sit in a brick flower box. The entry has a pair of metal and glass doors with tile steps and a railed wheelchair ramp (**Photograph 7**). Another, smaller, more hidden entry is situated around the corner to the west and is composed of small concrete steps leading to a sliding door (**Photographs 8**). Just west of this entry is the access point for a designed, L-shaped garden courtyard, bound to the west by a chain-link fence covered in ivy (**Photograph 9**). The inner portion of the courtyard has two large fixed floor to ceiling windows

and a third section has a pair of glass doors with wooden stoop on the west end (**Photograph 10**). The east side of the courtyard has five large fixed metal windows with a utility access door. A corner door with a multi-light window has a concrete stoop and flat roof with metal pole supports (**Photograph 11**).

B10. Significance:

This update form was prepared to provide additional information about Building 60, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 60 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide

personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Johnson Drake and Piper constructed Building 60 in 1941. The building served as the Commissioned Officers' Mess and Officer's Club (nickname "O'Club") which provided food service as well as recreational activities. There were 307 living spaces for both male and female officers in addition to a dining room and cocktail lounge where entertainment such as the Glenn Miller Orchestra and Woody Herman performed. There was also a cigar mess, bowling alley, newspaper service, telephone room, barber shop, laundry, press shop, and pool tables. Between 1947 and 1948 membership averaged 150 officers. An outdoor barbeque facility (Building 419) was constructed adjacent to the courtyard in 1956 to serve the Officer's Club.[1]

Other modifications to the building took place in 1958 when a galley was either added or upgraded. The front entrance was modified in the early 1970s, as well as a major upgrade to the galley and some of the sleeping quarters. During 1987 the Navy removed asbestos from the building. In 1997-98 the wheelchair ramp was added to the main entrance.[2] In 1996, three years after the base was decommissioned, the City of Alameda began utilizing the O'Club and maintains the facility.[3]

Evaluation

Building 60 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining

State of California — The Resources Agency **Primary #** P-01-010022
DEPARTMENT OF PARKS AND RECREATION **HRI#**
CONTINUATION SHEET **Trinomial**

Page 10 **of** 10 ***Resource Name or #** (Assigned by recorder): Building 60

***Recorded by:** C. Brookshear and K. Clementi ***Date:** September 29, 2009 ☐ **Continuation** ☒ **Update**

features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[5] These are detailed on the attached sheets, and include smooth concrete surfaces of the building, horizontal orientation, flat roofs, emphasizing vertical elements, curved contrasting elements, original and sympathetic two over two windows, steel awning windows (including those at the rear patio area and to the side of the main entrance), and quoin-like dividers between windows. The curved lounge area east of the entrance provides both a vertical emphasis and curving contrast with the vertical element supplied by the height of the lounge and the vertically oriented windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 60, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 60 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 60, Officers Recreation Building.
3. Street: Ave. A at Fifth St. **NAS Alameda Map** J-27 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a one-story, concrete building with an flat, parapeted roof and an irregular rectangular plan, 117 ft. long, 52 ft. deep, and 19 ft. high. To the east of the entrance, which has a canvass covered walkway from the street, is a large rounded bay with six tall windows with metal frames and metal, hopper sash. The long wing to the west of the entrance has a series of openings with typical metal windows. Low concrete walls framing planters skirt the S side of the building and screen the building with vegetation. The N elevation is utilitarian and has been altered in various ways to accomodate a ramp for handicapped access and other service spaces. The E side has a delivery truck access and loading dock.

15. Alterations: Handicapped access ramp and alterations to service areas in the 1970s and 1980s that do not affect integrity.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Building 60 contributes to The NAS Alameda Historic District under Criterion A because it was built in 1941 and has continued to function as the Officers Recreation Building. Under Criterion C, the building is a handsome example of the simplified early Modern style employed in the design of the major permanent buildings on the base. Although the building has been altered in recent times, the alterations do not affect the appearance of the main elevation on Avenue A. The building also contributes to the streetscape on this important cross- axial street at the point where the officers housing compound begins.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

3.7. Character-Defining Elements of Building 30 and 31.

Buildings 30 and 31 were literally "gateway" buildings for the NAS Alameda and, for this reason, were given a degree of attention not commonly found in utilitarian buildings of this sort. The two buildings, along with the original gate posts to the east, were clearly designed as a group and are consistent with the design theme for the historic district. Building 30 is shown in **Photograph 33**. Among the character-defining elements are:

- Smooth concrete surface.
- Flat roofs with broad, sweeping concrete canopies.
- Characteristic oval columns, supporting the broad canopy.
- Sympathetic aluminum two-over-two double-hung sash.
- Cast stone eagle and flag figure on Building 30.

3.8. Character-Defining Elements of Building 60.

Building 60 -- the Officers' Club -- is the most heavily modified building within the historic district. The building offers strong evidence of the impact of replacement of the impermanent parts of a building, chiefly its windows and doors. While the basic form of this handsome building remains, the loss of the original windows and doors diminishes its architectural and historical importance. It now has a frankly modern overall appearance, owing to the replacement of the "soft" elements. Key character-defining elements include:

- Rounded main room at the facade, shown in **Photograph 34.**
- A few remnant original windows, including stacked windows in the rear patio area and to one side of the facade.

3.9. Character-Defining Elements of Building 94.

Building 94, the Chapel for NAS Alameda, was built during the middle of World War II, when concrete was scarce. Although a highly prominent building, it was built of wood, with a flush horizontal board siding, probably with a shiplap joint. This wooden siding appears to be in excellent condition. It was also fitted with a series of hipped roofs, also unique within the Administrative Core and within the historic district generally, except for the quarters, which also have hip roofs. Among the key character-defining elements for this building are:

- Board siding.
- Original double-hung, two-over-two windows on the north wall.
- Art glass windows in the chapel area.
- Stacked openings in the belfry.

Page 1 **of** 9 ***Resource Name or #** (Assigned by recorder) Building 62
***Recorded by:** S. Miltenberger and H. Norby ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 62 is not eligible for listing in the NRHP individually, nor is it a contributing element of the NAS Alameda Historic District, and has a NRHP status code of 6Z.

P1. Other Identifier: Civilian Cafeteria / NARDAC

P2 e. Other Locational Data: 1040 W. Midway Street; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete foundation, Building 62 has an irregular plan measuring 42,737 square feet with a second-story addition at the northwest corner (**Photograph 1**). The building is constructed of plywood formed concrete with a multiple plane flat roof. The south façade has four setback sections (**Photograph 2**). A double metal door entrance at the east had has metal concrete stairs and metal railing with a concrete canopy over the entrance; a concrete ramp is located to the west. Four window groupings have been boarded up west of the entrance. A window on the south end of the east section has a boarded up window. The second section has an entrance at the southwest corner with a metal personnel door, concrete stairs and concrete canopy. A group of three triple-hung metal windows is located on the south and west sides. The third section has a pair of two triple-hung windows flanking a pair of single triple-hung windows. The fourth section, located on the west side of the south façade, has a fenced area with external equipment located in front.

The west façade has two distinct sections that are separated by roof height. The southwest end has a flat roof, concrete block enclosure with a vent and metal utility door facing the fenced area to the south (**Photograph 3**). To the west are metal stairs and a raised concrete loading dock with two sets of double personnel doors and a single metal personnel door. A curved concrete canopy extends to the west to another small concrete block structure. Continuing west the building is two-stories tall. Another set of metal personnel doors at grade and a set of metal stairs lead to another elevated concrete loading area covered by a flat wooden shed canopy; a set of concrete stairs with metal railings is located on the west side. Two single and a double metal personnel door and boarded up triple-hung metal windows are located on the far west side of the loading area. Two three-light fixed pane metal windows are located on the second story. At the northwest end of the west façade is a set of concrete stairs to a platform with a metal and concrete staircase that leads to an exterior flat roofed entryway with a two-light fixed pane metal window facing west. A metal and glass double door with glass transom is located at the base of the staircase. Fenestration includes two three-light fixed pane metal windows and two narrow two-light windows.

The north façade has two distinct sections that are separated by roof height. The northwest section includes the main entrance on the east side and has a wide concrete porch with concrete stairs and metal railings with a double metal and glass door with glass transom. The main entrance has a flat metal canopy with a flat roof, partially enclosed entrance to the second floor with a three light fixed window. An exterior concrete and metal staircase leads from the west side of the main entrance porch and then east to the exterior entryway. Fenestration includes six three-light fixed pane metal windows on the second story and five sets of three triple-hung metal windows (**Photograph 4**). The northeast section of the west façade is one level; fenestration includes three groups of four triple-hung metal windows (**Photograph 5**).

The east façade has a similar setback appearance as the south side. The northeast section has a metal personnel door with metal staircase (**Photograph 6**). A set of four triple-hung metal windows is located to the south with exterior venting connected. The second section to the east has a Moderne-style entrance with double doors, concrete canopy, curved walls, and six recessed glass blocks on the north side of the entrance. Two curved concrete planters flank the concrete stair entry. Fenestration includes a pair of three-over-one windows with a metal cage covering. The nest section has a higher roof height, but is otherwise unadorned. The last section on the east side is rectangular and clad in stucco. Two groups of six applied decorative bays are located on the south and north ends (**Photographs 7** and **8**).

B10. Significance:

This update form was prepared to provide additional information about Building 62, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The station's main construction contractor Johnson, Drake and Piper constructed the initial portion of Building 62 in 1942 as a semi-permanent building and it served as the civilian cafeteria. An 'L' shaped section was added to the northwest corner of the building in 1944, which housed additional storage areas, refrigeration, and a dining room on the first floor. The second floor of the addition was also a dining room (**Photograph 9** and **Photograph 10**). The civilian cafeteria in Building 62 was a central meeting place for employees up through the 1960s, where hot food was served. Uses in the building expanded from just a cafeteria to include administrative offices, banking facilities, and a post office. In 1950s the Training Division was located on the second floor of the building until it moved to Building 101. Public Works remodeled the area vacated by the Training Division and moved their department offices from

Buildings 30 and 183 at the main gate into Building 62. In the late 1960s the Industrial Relations department was housed in the building. The Civilian Employees' Welfare and Recreation Association was also located in Building 62 until its new building was constructed across the street in 1969 (now demolished). The Bank American Trust Company and Federal Employees Credit Union occupied 2,610 square feet of the building in the 1950s and later expanded to 6,871 feet in the late 1960s. The credit union moved to Building 527, which it constructed, in 1970. During the 1970s, the hot food cafeteria was replaced with sandwich machines, the bank branch in the building became a Wells Fargo, and a small self-service post office was established in the building near the cafeteria.[1]

Photograph 10: Lower left corner, Building 62 after addition on northwest corner, September 1, 1945.[3]

In 1983 the building underwent a major alteration that converted the building from a cafeteria into a computer installation. This project included the construction of the prominent concrete addition on the east side of the building. After the construction project, the Data Processing Installation branch of the Navy Regional Data Automation Center (NARDAC), San Francisco was located in the building. NARDAC was established in 1978 and grew into a full-scale information processing center with regional and Navy-wide responsibilities for non-tactical data processing services and technical support.[4]

Evaluation

Although construction of this civilian cafeteria in 1942 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District, the building has been heavily modified and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity prevents Building 62 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area

> for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[5]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 62 was placed in the latter category because the building was so altered through multiple changes over time that it did not contribute to the district.[6] Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the building was originally constructed during the period of significance, many exterior and interior changes have been made to the building since that time, most importantly its conversion for use as a data processing center in the early 1980s. Building 62, therefore, does not convey its association with the context of naval air stations built in 1930s and World War II, and is not a contributing element of the historic district.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 62, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 62
3. Street: Second St., **NAS Alameda Map** M-23 City: Alameda
Zip: 94501 County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: district Number of resources documented: 85
7. Existing condition: a one-story, concrete building originally 61' long x 171' wide, which received a much larger two-story addition in 1983. The original portion retains its fenestration and entryway consisting of a slightly recessed double door with a rounded architrace and flat, squared-off roof cantilevered from the wall above. The entrance is raised 9 steps, flanked by metal railing and curved concrete walls that also form planters.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: U.S. Government
10. Type of ownership: public
11. Present use: public
12. Zoning: none
13. Threats: none

HISTORICAL INFORMATION

14. Construction date: 1942 Original location: same
15. Alterations: A large two-story, concrete block added to S. side in 1983
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic Attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Context for evaluation: Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District. Context formally developed: yes

19. Context: Building 62 is judged to be non-contributing to the NAS Alameda Historic District because, in 1983, an addition about twice the size of the original 1942 building was added to one side destroying its integrity.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C 22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990
24. Survey type: Visual inspection 25. Survey name: Section 110 (A)(2)
26. Year form prepared: 1990 By: Sally B. Woodbridge Organization: none

This form is an update to the previous recordation of this building in "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992 by Sally B. Woodbridge (see attached). The re-evaluation contained herein concludes that Building 64 is eligible for listing in the NRHP as a contributing element of the NAS Alameda Historic District. Its NRHP status code is 3D.

P1. Other Identifier: Boiler House/ SIMA Diving Locker

P2 e. Other Locational Data: 1651 Ferry Point on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 64 is a one and a half story 986 square foot building with a rectangular plan and flat roof. The base of the building is made of board formed concrete, while the remainder is plywood panel formed concrete. The building rests on concrete and wooden piers that are sunk into the Seaplane Lagoon **(Photograph 1)**. The southeast side has a corrugated metal roll-up door with a pair of three-over-three windows above the door. A personnel door with a four pane window, and a cantilevered concrete canopy flanked by a pair of one-over-one windows is on the southwest side. Concrete and wood walkways with metal railings extend from the wharf over the water to both the roll-up door and personnel door. Fenestration on the remainder of the building is comprised of tall, vertical, three part windows with a two-over-three windows on top, a four-over-three windows, and a single pane on the bottom. These columns of windows are place in sets of two and singly. Also on the building are six-over-three and six-over-one windows **(Photograph 2)**.

B10. Significance:

This update form was prepared to provide additional information about Building 64, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

This context provides information on the development of the NAS Alameda Historic District and the contributions of Building 64 to the significant historical associations and architectural character of the historic district focusing on the period of significance preceding and during World War II.

The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country during the mid to late 1930s. During World War II, NAS Alameda was effectively adapted to support naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to serve and support its important wartime activities. NAS Alameda was one of three major air stations on the west coast to support operations of aircraft carrier groups, patrol squadrons, and utility squadrons, and it conducted crucial functions for aircraft assembly and repair. Following naval aviation's successes in World War II, the Navy established the aircraft carrier as a central basis for naval operations, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. NAS Alameda supported carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, and continued to carry out its main function of aircraft overhaul and repair. Much of the focus for military development during the Cold War, however, was on research and development of innovative aircraft and weapons. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of Cold War naval missions and activities.

NAS Alameda has its origins in the build up to World War II. As military tension around the world increased in the late 1930s, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur J. Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. The assertive conclusion of the Hepburn Report in 1938 was that the need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning. The Hepburn Board recommended establishing NAS Alameda as one of the major air stations on the west coast supporting both operations and aircraft assembly and repair (A&R). NAS Alameda, along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program, although Congress had already approved funding for NAS Alameda in 1937.[1]

Webster, United States Army Construction Engineering Research Laboratory, "Historical and Architectural Overview of Military Aircraft Hangars," Prepared for United States Air Force Headquarters, Air Combat Command, 1999 revised 2001, 3-41 and 3-43; JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 1-1; Jones & Stokes, "Pre-Final National Register of Historic Places Nomination for the Naval Air Station Alameda Historic District" (prepared for Naval Facilities Engineering Command, Southwest and Base Realignment and Closure Program Management Office West, January 2008), 8; and Allbrandt, "History of the Naval Air Station and Naval Aviation Depot at Alameda, California" (May 1996), 2; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 229.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[2] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. Following the Hepburn Report, BuDocks and BuAer further refined standards and requirements for naval air stations. However, local conditions necessitated alterations for improved functionality at given locations.[3] NAS Alameda followed many of the standards and requirements of the period. Yet, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report.

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The location of natural features relating to the docks and seaplane facilities determined the final placement of this interlocking system of activities. As a result of this functional organization, naval air stations designed and built in this period share similar organization with modifications for local conditions.[4]

The NAS Alameda base plan also had a comprehensive aesthetic design, in addition to its functional organization. The City Beautiful movement heavily influenced planning in the United States in the first half of the twentieth century, and can be seen in city planning as well as institutional settings such as college campuses. The movement borrowed planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, which were employed on NAS Alameda. Various *partis* or shapes, such as buildings or courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military employed Beaux Arts inspired plans since World War I to develop the many

Sullivan, "Base Planning," *Civil Engineering Corps Bulletin* (April 1947): 118-122.

new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [5]

BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes. In these early plans, the north-south axis ran from the north entry gate, bisected the entry mall and Building 1, and terminated at the center line of the Seaplane Lagoon to the south. The original east-west axis bisected an open area separating the living quarters / administrative core from the shops and operational portion of the station, and was aligned with the middle of the airfield on the west end of the station. Operational areas like the Seaplane Lagoon were sited either directly on the axial line or paralleled an axis.

The importance of waterfront activities is illustrated in the Navy's construction of the Seaplane Lagoon before the landplane airfield and that the Seaplane Lagoon was a critical feature in the design of the station layout highlighted by its symmetrical location on the main north-south axis of the station plan. The heavily trafficked Oakland Inner Harbor along the north side of the station was not a suitable location for seaplane operations, so the lagoon was placed at the south end of the axis, with access to open landing water. Its layout was nearly bilaterally symmetrical to the land area of the station, except where the railroad spurs serving the piers clipped the southeast corner of the lagoon, the alignment of which existed prior to Navy acquisition of the site. The east and west sides of the lagoon adjoin and placed in line with the two of the main north-south streets that flank the Shops and Administrative Core areas, that form the core of the station. The north-south measurement of the lagoon is equal to and correlates with the distance from Red Line Avenue to Tower Avenue that flank the other sides of the Shops and Administrative Core areas. The original Airfield was subject to similar axial and proportional considerations. As a result, the Seaplane Lagoon is nearly the same size as the core of the station and the original Airfield. These three pieces formed the station and reflect the station operations.

In addition to the careful master planning for the station following principles of organization, functionality, hierarchy, and efficiency, the Navy also designed prominent buildings on the station in a manner that corresponded with the efforts to create a modern and organized facility. This was achieved by adhering the station's plan to a Beaux Arts formal spatial layout and by designing most of its prominent buildings in the Moderne style, which blended neo-classical proportion, symmetry, and order with modern design concepts of the time.[6] The planning and architecture on NAS Alameda demonstrate trends which BuDocks designers drew upon related to campus planning, modernistic design, and the continued traditional architectural expressions of federal buildings during this period.[7]

Architects worldwide began to abandon historical revival styles during the late 1920s and especially during the 1930s in favor of designs that consciously illustrated modernity and technological progress using simplified geometric forms and ornamentation. This trend developed mostly from European modernistic art and industrial design, but transferred

[6] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003), 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

[7] Paul Venable Turner, *Campus an American Planning Tradition* (Cambridge, Massachusetts: The MIT Press, 1984) 188, 191, 196, 209; Jon A. Peterson, *The Birth of City Planning in the United States, 1840-1917* (Baltimore, Maryland: The John Hopkins University Press, 2003) 319-320. The buildings on NAS Alameda have also been described as being Art Deco. The architectural styles of Art Deco and Moderne are sometimes used interchangeably, but this obscures the differences between them and the development of the modernistic styles in the United States during the 1920s, 1930s, and early 1940s.

to architecture wherein it presented sleek and spare designs of the Art Deco, Moderne and later International styles. Often buildings designed in the new style(s) of the period retained proportion, symmetry, and order found in buildings inspired by Classical architecture, but without direct allusion to historical styles. Materials such as concrete, metals, and glass block – all of which were used on NAS Alameda – were prominently used to illustrate a directness regarding building fabric to help portray the machine / technological-inspired aesthetic. The rapid evolution of aviation and other forms of transportation during the 1920s and 1930s particularly inspired designers to illustrate in architecture and industrial design modern society's departure from the past that was seemed apparent, or was being sought, at the time. The expansion of civilian and military aviation was symbolic of modern technological achievement and streamline forms appeared in and influenced the design of seaplane and landplane aircraft as well as in the buildings of the growing nationwide network of civilian airports. Modest buildings at NAS Alameda, like Building 64, lacked ornament and depended upon proportion and simple form to provide their architectural interest.

Building 64 was built in the Seaplane Lagoon as a part of the organizational and function plan for the station using a simplified version of the prescribed building style. Johnson, Drake & Piper built Building 64 in 1941.[8] The building housed a boiler that provided steam for heat and other uses at the adjoining piers and miscellaneous shops throughout the station, constructed within the Seaplane Lagoon where it would be largely protected from the harsher environment of the open bay by the piers. The building is located within the Seaplane Lagoon at a location that early plans showed was to be used for operational facilities. Its location reflected its direct functional relationship with ships at the pier, wharf, and seaplanes in the lagoon as part of waterfront operations.[9] The boiler immediately underwent rework to accommodate the use of fuel oil.[10] It helped supply 'cold iron power' for the carriers docking at Pier 2 and by 1945 also at Pier 3. "Cold iron" is the term used to refer to a ship when it docks and powers down their engines, then plugs into port-provided-power which continues to run all of their on-board equipment such as refrigeration, cooling, heating, and lighting, anything that requires a power source to run. The "cold iron" practice was expanded extensively as vessel size and logistics for managing ships grew during the latter half of the twentieth century.

In 1971 the Mobile Utility Service Equipment (MUSE) was installed on Pier 3 to meet carrier cold iron requirements and by 1972 Building 64 was still listed as a steam plant-power facility.[11] In 1973 Pier 2 was upgraded and the MUSE system was moved to Pier 2 to provide an alternate power source while the upgrade was in progress. The MUSE system was originally installed on railroad tracks on Pier 3 in 1971, this installation gave the Navy the option to easily move it from pier to pier as needed. In 1977 the ongoing rise in the demand for power to the pier was resolved when the Pier Utilities Boiler Plant was built and went online. This was a permanent power plant on the base which could support cold iron power requirements to ships at both Piers 2 and 3, and replaced the portable MUSE system. [12]

[12] "Boiler Plant Underway," *The Carrier*, 18 August 1975.

Also in 1973 the Fleet Maintenance Assistance Group (FMAG) arrived to NAS Alameda.[13] This group provided training for technical ratings while at the same time repairing carriers and providing ship maintenance.[14] As a part of this activity Building 64 was then established as a diving locker allowing work to commence on hulls and other underwater systems.

In 1981 Building 64 had was repaired and painted and by 1989 FMAG evolved into Ship Intermediate Maintenance Activity (SIMA) that emphasized the underwater ship maintenance work rather than the training. [15] The SIMA personnel would inspect the hulls of ships, as well as replace propellers on destroyers and small ships and perform any underwater maintenance, which might be required.[16] These divers were highly trained and their duties included repair of the harbored ships in the pier area as well and sea rescue and salvage operations.[17]

Evaluation

In terms of Building 64's place within the existing NAS Alameda Historic District, this evaluation concludes that it is a contributing resource because of its shared association with other contributors to that district's significance under Criterion A, for its contribution to the nation's defense during World War II, and under Criterion C, for its style and architectural importance. The original district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[18]

Woodbridge considered Building 64 a non-contributor to the district because of its isolation from other buildings and structures within the NAS Alameda Historic District. The previous evaluation had recognized its historical association with the district and research for this project confirms this association. Reconsideration of the district boundaries and evaluation of the Seaplane Lagoon has expanded the district to include the lagoon. Projecting into the lagoon, Building 64 is within the boundaries of the historic district in an area that retains integrity. The lagoon and waterfront features like Building 64 were an important part of station operations and the total base design of NAS

Alameda. Due to the reconsideration of the NAS Alameda Historic District boundaries, Building 64, located on the Seaplane Lagoon, is now within the NAS Alameda Historic District. In addition, the building retains sufficient historic integrity to the historic district's period of significance.

Building 64 is a contributor to the NAS Alameda Historic District, which is significant at the state level under NRHP Criterion A and NRHP Criterion C. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development during the period of significance 1938-1945. Building 64 is significant for its association with the historic district's importance in naval air station development and the role NAS Alameda served during World War II. In addition to its historical significance, Building 64 also retains sufficient historic integrity to convey its significance to the historic district's period of significance.

Under Criterion A, Building 64 is a contributor to the NAS Alameda Historic District because of its important role supplying steam for ship and industrial use on the station and its association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the station's role in Pacific theater naval operations during World War II. The later changes in its use, have not diminished the building's ability to convey this association. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention given to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and then successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. Building 64 provides a direct link to NAS Alameda's initial development and its support of a central and vital role in the Pacific theater.

Under Criterion C, Building 64 is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation. The location in the lagoon with the ability to provide steam for ships docked at the nearby piers and shop facilities built to the east demonstrates the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period, and it shows the magnitude the Navy placed on the design to illustrate the modernity and importance of the naval aviation strategy for the Pacific Fleet. The continuity of the architecture with other operational buildings further support the importance placed on the design. Completion of the station plan was sped up and then successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional design enabled the station to rapidly expand to serve and support this important wartime activity.

The station does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The

station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

Building 64 is significant and it retains sufficient historic integrity to convey that significance. It has the physical features that relate to its significance, and it retains elements of all aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

Building 64 shares character-defining features with many of the shop facilities on NAS Alameda as identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[19] The main character-defining element of these buildings, and Building 64, is the poured concrete building material and smooth surface. With such a simple building material the smaller features such as windows become character-defining. In this case the symmetrical, vertically stacked, industrial windows. The curved hood over the southern entrance is another character-defining feature of the building. No interior character-defining features were identified for Building 5.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[20] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure at NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 64, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

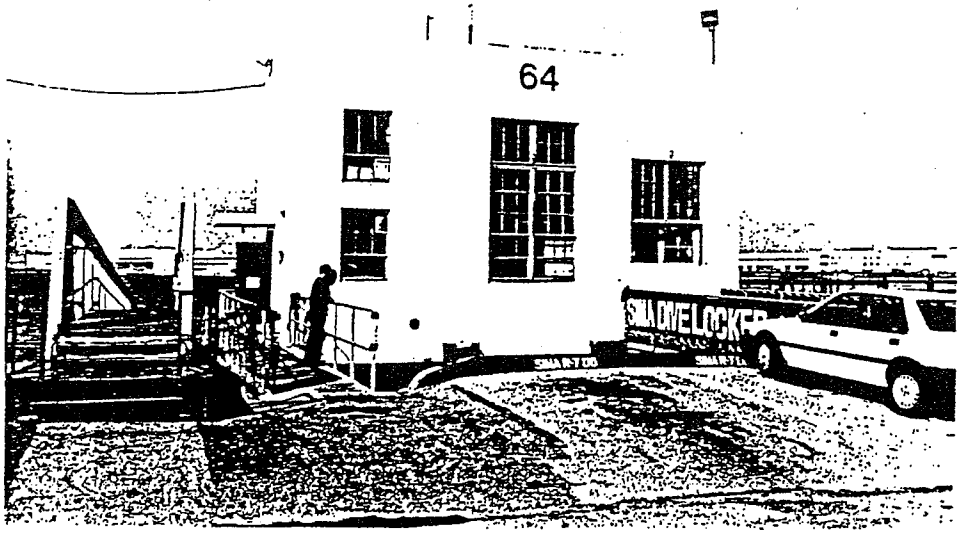
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 64, SIMA Diving Locker
3. Street: Fifth St. **NAS Alameda Map** U-27 CITY: Alameda Zip: 94501
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a rectangular, concrete building, 37 ft. long by 26 ft. wide and 20 ft. high. The building is preceded by a sunken area in front of an exposed basement floor; gangways bridging this area lead to the entrance on the S side which is sheltered by a concrete slab cantilevered from the roof above. The SE elevation has four metal-framed windows of different sizes with hopper sash, the largest, which has 6 sections, is in the center.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none



HISTORICAL INFORMATION
14. Construction date: 1941 Original location: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION
18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Although Building 64 was constructed in 1941 and belongs to the early construction phase on the base, it is located in an area far removed from the central core of early buildings where on-going construction has altered the original character of the base. Although the building itself is unaltered, its architectural significance is not great, and it may not contribute to the NAS Alameda because of its isolation.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none
23: Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1991
24. Survey type: visual inspection

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 66
***Recorded by:** M. Bunse and R. Flores **Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 66 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Engine Accessory Test Shop

P2 e. Other Locational Data: 451 West Atlantic Avenue, on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 66 is a two-story rectangular plan concrete building with flat roof and one-story bays on the west and east sides. The building has multiple tall garage doors on three sides and its fenestration includes multiple sash industrial windows with awning openings. The west side's four bays are located only at the south end of the building. This portion of the building has a shed roof and each bay has a folding metal panel door with glazing. The central west facing sliding door has metal industrial sash windows and a personnel door **(Photograph 1)**. The north end of the building is shorter than the rest of the building and is partially divided into two stories, with access to the upper story via an exterior metal stairway. Next to the roll-up garage door there is a glass panel personnel door and a double door at the east corner. The ten east side bays are similar to those on the west side. The shed roof bays extend the whole length of the building and have two glass panel personnel doors. The south side's central opening appears to have been altered and now has a shorter roll-up door at the ground level with closed opening above it. A metal utility staircase leads to the second story entrance from a personnel door near the east corner **(Photograph 2)**.

B10. Significance:

This update form was prepared to provide additional information about Building 66, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the station's original design axial and formal layout. The Navy began construction of Building 13 in 1941 and the following year in 1942 four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building 66 was constructed as a salvage building by contractors Johnson, Drake and Piper with a mezzanine addition constructed into two phases between 1942 and 1945 by the same company. A portion of the north end of the building was added in 1942 and 1943. Building 66 originally worked on conventional aircraft engine components and was reassigned to work on jet engines when that overhaul work was assigned to NAS Alameda. Jet engine overhaul was moved to Building 360 when it was completed in 1953 and Building 66 was used as a jet engine accessory overhaul and test facility, including work on fuel control devices. Engine accessory overhaul on conventional aircraft was conducted in Building 162.[4]

Rapid development of jet engine technology required larger and more complicated fuel systems to provide the highest power output technology could permit. To meet this requirement, fuel systems were designed to provide greater fuel flows and higher pressure. Jet engine accessory units such as fuel controls, fuel pumps, and valves were built to meet the more intense requirements and the Navy tested these accessories for proper operation prior to installation in aircraft in Building 66. These tests confirmed proper reassembly and repair. Such testing, under high flows and pressures with combustible fuels, was considered hazardous and required special handling. Building 66 required additions to hold the larger more complicated fuel systems of modern jets and for equipment required to test the accessories to their full power capacity. The Navy reworked Building 66 in 1954-55, constructing the east and west side bays to house controls outside the building since the original building was not explosion proof. The Navy also built a two-story addition at the northwest corner of the building to house testing equipment and built 100 by 20 foot mezzanine and two enclosed hazardous test areas to the interior of the building during the remodel.[5]

Evaluation

Building 66 was constructed between 1942 and 1943 with alterations and additions in 1954-55. Although construction of the Building 66 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), the building lacks architectural significance, as well as historic integrity of setting, design, and feeling, thus it does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity and utilitarian building style prevents Building 66 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district boundaries

[5] William P. Burke, "Plan Hazardous Test Building," *The Carrier*, 17 June 1955.

were drawn to include areas which were part of the station's formal plan that included a concentration of resources which retained historic integrity and shared architectural similarities. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[6]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 66 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and that included considerable post-1945 construction. These factors prevented the area from conveying the appearance of the station during the period of significance (1938-1945).[7] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility (Building 66), the locomotive repair shop, paint / oil storage, and engine test cells. Research undertaken for this project in building plans, station maps, and aerial photographs indicates that this area was not a part of the original formal station plan and that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[8] Expansion in this area began during World War II, but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. Expansion in this area did begin during World War II but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. In addition, Building 66 itself lacks integrity of design, materials and workmanship because of its 1954-55 addition.

The history of the station during the Cold War illustrates that Building 66, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those

undertaken at other air stations and Naval facilities around the nation.[9] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 66, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 66 serviced technologically sophisticated aircraft and weapons systems -- it did not play a significant role in their research, design, testing and evaluation, functions that might have imbued it with exceptional significance.

Building 66 is not eligible for listing in the NRHP individually, nor is it a located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 67 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Locomotive Shed / Automotive Repair Shop

P2 e. Other Location Data: 400 West Seaplane Lagoon on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 67 is a wood framed rectangular concrete multi-level former locomotive shed and railcar repair shop that was later used for various purposes including as an automotive repair shop. The building is on a concrete slab with an addition on the northeast corner and a flat parapet roof. It is approximately 12,700 square feet. The south side two-story section has three large metal overhead doors. The one-story section to the west is plain and the east has three sets of two-part sliding aluminum single pane windows and a personnel door **(Photograph 1)**.

The west side has six groups of industrial sash windows on the first and second stories. The first level has centrally located double metal doors **(Photograph 2)**. A wood shed roof over two sets of windows at the northwest corner connects Building 67 to Building 263 **(Photograph 3)**.

The north side has the same three overhead doors as the south side. The west side is plain and Building 412 addition is located toward the northeast end. The east side was largely not accessible. The two-story section has six window groups that mirror the west side **(Photograph 4)**.

B10. Significance:

This update form was prepared to provide additional information about Building 67, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of

Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the station's original design axial and formal layout. The Navy began construction of Building 13 in 1941. In 1942, four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building 67 was constructed by Johnson Drake and Piper.[4] It was originally used as a locomotive shed, battery charging station, and railcar repair shop. Later uses included a welding shop, mechanical and maintenance shop, aircraft ground support shop, and a switching substation and automotive repair.[5] By 1987 it was being used as an equipment storage facility and in 1992 as a recycling center.[6]

Evaluation

Building 67 was constructed in 1942. Although construction of the Building 67 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District, the building lacks integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1) or NRHP Criterion C (CRHR Criterion 3). The original district boundaries were drawn to include areas which were a part of a formal station plan that included a concentration of resources which retained historic integrity and shared architectural similarities. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[7]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 67 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and that included considerable post-1945 construction. These factors prevented the area from conveying the

appearance of the station during the period of significance (1938-1945).[8] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the locomotive repair shop (Building 67), paint / oil storage, and engine test cells. Research undertaken for this project in building plans, station maps, and aerial photographs indicates that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[9] Expansion in this area began during World War II, but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. While building 67 shares the architectural styling of the key buildings in the NAS Alameda Historic District, such as Building 43, it is a simplified and more utilitarian version of this architectural style. The architecture of Building 67 is not of sufficient merit to qualify it for individual listing under Criterion C (CRHR Criterion 3). In addition, Building 67 is isolated from the district by more utilitarian structures and modern construction in the surrounding area, and thus remains outside the historic district boundary.

The history of the station during the Cold War illustrates that Building 67, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[10] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 67, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 67 performed standard maintenance and storage functions found throughout the Navy. In addition, although the building appears to retain integrity to its period of construction, the building was unremarkable for its routine maintenance role on the station.

Building 67 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

13. Threats: none

HISTORICAL INFORMATION

14. Construction date: 1942 Original location: same
15. Alterations: additions to each side of main block.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: Military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Although Building 67 was constructed in the early period of the base development in 1942, it appears to have been altered. Although the additions to the building sides may have been made within the period of significance, the building is located in a part of the base that has changed a great deal since World War II. The loss of integrity to the area is deemed a reason for making the building non-contributing in respect to the district under Criterion A. Under Criterion C, the building is representative of the simplified early Modern style in which the early permanent buildings of the base were designed. However, it is not an outstanding example of this type and does not qualify for individual recognition as historically significant.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the postwar years. (See Continuation Sheet.)

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings and structures constructed during the Cold War era, or World War II-era buildings and structures used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these period. Building 68, completed in August 1988 as a waterfront repair shop, is just such a building. It did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles either during the Cold War era.[1]

Many buildings and structures on NAS Alameda, such as Building 68, fall within the "Waterfront Operations" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include piers, wharfs, dolphins, diving lockers, maintenance shops, crane tracks, and navigation range lights. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. These buildings are utilitarian and many are of prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, these buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

Evaluation

Building 68 was built in the midst of Cold War operations on NAS Alameda, and was part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation. [3] In the larger context of the naval operations in California and nationwide during this period, the Waterfront Operations function of the building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Building 68, moreover, while retaining integrity to the period when it was constructed was nevertheless unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The building is utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It has no direct or important association with a historically significant individual, and is unlikely to reveal important historical information (NRHP Criteria B and D / CRHR

Criteria 2 and 4). Furthermore, despite serving a necessary purpose on NAS Alameda during the Cold War era, the construction and use of Building 68 is not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 75 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Officers' Bath House

P2 e. Other Locational Data: 707 West Red Line Avenue; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 75 is the Officers' Bathhouse. Originally called 75A, it was built as one of three associated buildings: Building 75B (pool) and Building 75C (snack bar). These last two buildings are no longer extant, thus the building is now referred to as Building 75. Building 75 is a one-story, irregular shaped concrete building with a flat roof **(Photograph 1)**. The façade, which faced West Red Line Avenue, has a personnel door with boarded-up window on the west side and a second personnel opening in the center which is covered by a metal roll-up door. There are several window openings on this side, all of which have been boarded up.

The north side of the building, which once opened onto the swimming pool, has a central recessed porch covered by a cantilevered roof with rounded corners supported by metal poles. There are personnel door openings on the porch, all of which have been boarded up. There are also several boarded-up windows openings on this side of the building **(Photograph 2)**.

B10. Significance:

This update form was prepared to provide additional information about Building 75, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 75, the Officers' Bath House, was once part of a recreation facility comprised of Building 75B (pool) and Building 75C (snackbar). Building 75 was constructed in 1942 by Johnson, Drake and Piper and housed dressing rooms, baths, showers, and toilets, as well as the pump house for the pool. The other two components of this recreation facility, the pool and snackbar, have been removed.[1]

Evaluation

Building 75 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[2] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 75 was recorded by the previous studies (attached), and the character-defining include its plain façade, flat roof, and curved corners on the porch roof.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes.

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the

Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] Building 75, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 75 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

***Recorded by:** S. Miltenberger and H. Norby ***Date:** October 8, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 77 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Radio-Radar Building / Air Terminal

P2 e. Other Locational Data: 2151 Ferry Point; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The building remains generally as Woodbridge described with general clarifications. Building 77 is a three-story concrete building with a third floor composite wood panel addition. The main entrance to the building is centrally located on the south side. It is recessed with rounded corners and is sheltered by a flat roof. Concrete steps lead to two sets of glass and metal double doors which are flanking three plate glass windows; above these doors and windows is a course of fixed transom windows. The second and third floors above the entrance are also recessed. On the second floor a set of metal double doors sheltered by a small, flat concrete roof which opens onto a deck above the main entrance **(Photograph 1 and Photograph 2)**.

Fenestration on the building consists largely of horizontal bands of metal, multi-sash hopper windows in groups of four. These windows are also placed singly and in pairs. In addition there are plate glass windows and three-part aluminum sash sliding or casement windows on the third floor. Besides the main entrance, other doors include metal personnel doors both with and without windows. The east and west sides each have a doorway on the first and second stories with fixed transoms. The second story doors are reached metal stairways and continue to the roof. The first floor door on the east side also has a metal stairway, while door on the west has concrete stairs and platform covered by a corrugated metal roof. Of the two metal personnel doors on the north side of the building, one is accessed by concrete stairs and the other by a long concrete ramp. Each of these is sheltered by a small, flat concrete roof. On the east end of the north side is a flush loading dock with a metal roll-up door covered by a flat, steel frame, corrugated metal roof **(Photograph 3)**.

B10. Significance (cont.):

This update form was prepared to provide additional information about Building 77, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 77 was constructed by Johnson, Drake, and Piper in 1942 as a Radio and Radar Building, which contained facilities for the repair and overhaul of all radio and radar equipment. (**Photograph 6**) At the time, radar was an evolving technology and carefully safeguarded. Building 77 included an interior room, or 'vault,' with concrete walls and a single steel door with integrated combination lock. The room lacks connections (ventilation, etc.,) with other rooms and appears suitable for securing classified materials **(Photograph 4)**. Alameda Naval Air Museum President Marilyn York indicated that the vault, at one time, contained secret documents related to what the Department of

Defense called "Broken Arrow," which referred to nuclear weapons accidents or incidents where the military lost nuclear weapons.[1]

Photograph 6: Circa 1945 photo of Building 77.[2]

Research conducted for this project cannot confirm the use of the vault over time or its contents during specific periods of time. Such information may have been classified. No documents related to this issue remain in the vault, however. Additionally, no known military nuclear weapons accidents or incidents appear to be connected with NAS Alameda.[3] Building 77 also housed the operations department for the seaplane squadrons. Facilities included a machine shop, metal shop, paint shop, cable shop, etc., and shops for the repair of radio and radar equipment **(Photograph 5)**. In 1960 the building opened as the new air terminal and operated similarly to a bus station, providing services for temporary visitors.[4]

Contractor Robert L. Wilson constructed extensive renovations to Building 77 under contract NBy-20871 between 1958 and 1960 to convert the building into the new air terminal. Most notably, a third story, clad in plywood veneer and fenestrated with rounded bay windows, was added to the building to house showers, lockers, and sleeping quarters for officers and enlisted men to use during brief stopovers **(Photograph 7)**.

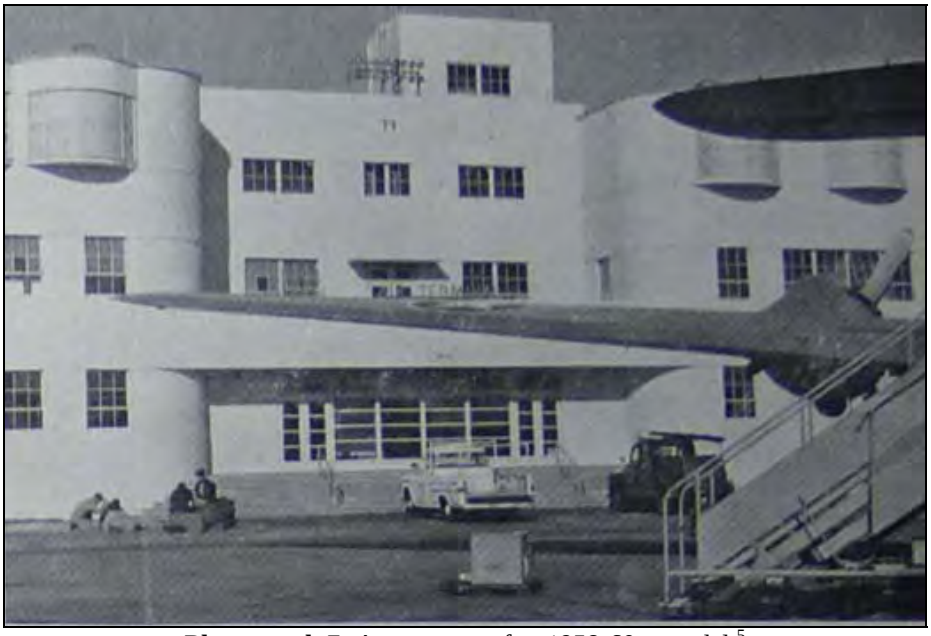

Photograph 7: Appearance after 1958-60 remodel.[5]

The first floor of the building was converted to house the Air Terminal Officer's office, a passenger lounge, ticket counter, and baggage facilities. The second floor was occupied by a new cafeteria operated by the Navy Exchange and the Naval Overseas Air Cargo Terminal staff. The air terminal staff vacated Building 106 to move into their new building. The mission of the Air Terminal was to provide services to the Fleet, as well as passenger and cargo services to flights of transient aircraft and flights scheduled by area commanders. In terms of volume, in 1967 alone more than 7,000 passengers, 89,000 pounds of baggage, 6,700,000 pounds of cargo and 94,000 pounds of mail were processed through the Air Terminal during 24-hour, seven-days-a-week operation.[6]

In the 1960s the Aviation Safety Office was located in the building. The officer in charge was responsible for the aviation safety program of the station, investigating aircraft accidents, acting as liaison between station squadrons and tenant activities, inspecting airfield facilities, and had 20 aircraft, including transports, jets and helicopters under his supervision. In the 1970s the "Crows Nest" restaurant, operated by the Navy Exchange, was added and a self-help project started in 1977 to renovate and improve the terminal facilities. By the early 1980s, the Air Terminal was the largest Naval Air Terminal on the west coast and was the eastern terminus for the majority of Navy Trans-Pacific flights.[7]

Evaluation

Building 77 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[8] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. Although Building 77 has the third-story addition that utilizes different building materials than the original building, the curvilinear lines used in the addition are consistent with the Moderne architectural style of the building and do not significantly deteriorate its integrity. The previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[9] These are detailed on the attached sheets, and include smooth concrete surfaces of the building, horizontal orientation, flat roofs, curving entry composition, and wide ceremonial entry stairs.

The history of the station during the Cold War illustrates that neither the previously determined eligible historic district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[10] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 77, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 77 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. and 2. Historic/Current name: Building 77, Air Terminal
3. Location: Parking Apron #4, **NAS Alameda Map**: Q-27 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a 4-story, concrete building, 64 ft. long, 49 ft. wide, and 33 ft. high, with a flat, parapeted roof and an dumb-bell plan. The S elevation has rounded corners framing a central, recessed entrance with 5 glass and metal doors reached by a flight of seven steps with metal railings. Typical windows are metal-framed with multiple-light hopper sash. Metal fire escape stairways with railings give access to the upper floors and to a roof deck above the third floor on the E elevation. The building is unaltered and in good condition.

HISTORICAL INFORMATION

14. Construction date: 1942 Original location: same
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Building 77, the Air Terminal, contributes to the NAS Alameda Historic
District under Criterion A because it was constructed in 1942 as part of the central core of base facilities and has continued to serve its original function. Under Criterion C, the terminal was designed in the simplified Modern style that characterizes the permanent buildings on the base and is unaltered and in good condition.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C.
22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990

4. HANGARS AREA

4.1. Architectural Vocabulary of Buildings in the Hangars Area

The Hangars Area is of obvious historical importance to the NAS Alameda, which operated as an air station for more than half a century. The hangars are also among the most imposing structures within the historic district, with each building looming large and the rows of hangars creating dramatic vistas. **Photograph 35** shows the vista created by Buildings 77, 39, 40, and 41. **Photograph 36** shows the equally dramatic vista from the hangars to San Francisco Bay. The Hangars Area includes Buildings 20, 21, 22, 23, 39, 40, 41, and 77. The area exists on two sides of the historic district, facing First Street to the east and Avenue F to the north.

Although it is the most imposing area from the structural standpoint, it is a much less complex area from the design review standpoint because the buildings are nearly all the same. The seven hangars -- Buildings 20, 21, 22, 23, 39, 40, and 41 -- are essentially identical. Building 77, the passenger terminal is unique.

4.2. Surface Materials, Basic Building Forms

The seven hangars are large, steel framed buildings, surfaced in thick stucco with tall concrete foundations, or bulkheads. At the two ends of each building, the "walls" are taken up almost entirely by the hangar doors, along with the pockets for those doors at either side. These large pockets are like pylons in their sculptural form. On the side elevations, the door pocket pylons flank a two-story band of office and shop space. The hangar buildings include shed-roofed light monitors on the rooftop. The basic shape of the end wall is shown in Photograph 34; the shape of the side office wing is shown in **Photograph 37**.

Although massive, the seven hangars are rather simple buildings, from the structural as well as the architectural standpoint. In terms of the basic structure, the character-defining elements include:

- Smooth stucco surface above a tall concrete bulkhead.
- Prominent pylon-like door pockets, integrated into the structure (these door pockets are often freestanding).
- Rooftop monitors.
- Grand interior hangar spaces with office wings to either side.

The design review considerations for the basic form of the hangars include the following:

- Respecting the exterior appearance while providing maximum flexibility in the re-use of the hangar spaces. It is nearly inevitable that the huge hangar spaces will need to be subdivided for re-use. In terms of the visual contribution of these buildings, the subdivision of those interior spaces should have little or no effect on the historic district as a whole.
- Respect for the exterior appearance includes discouraging construction of additions.

Building 77 is in the Hangars Area but is a much different building type. Because it was a gateway building -- a building frequented by the visiting public -- Building 77 was treated architecturally as if it were part of the Administrative Core. The front of the building -- the elevation meant for public enjoyment -- faces the taxiway. At this elevation, Building 77 is a very Moderne structure, with curved surfaces leading to the central entry, as shown in **Photograph 38.** The entry includes a wide concrete stairway. The rear (north elevation) of the building faces the Shops Area and is much more utilitarian in design. The rear and side elevations are shown in **Photograph 39**.

Character-defining elements of Building 77 include:

- Smooth concrete surface.
- curving entry composition.
- Wide ceremonial entry stairs.

As discussed in the introduction, Building 77 was modified to include third story wings and single-pane, picture windows at the facade. This type of addition and window modification is instructive with respect to the types of modifications that should be discouraged under the design review process. The addition, one of few in the historic district, matches the curvature of the original but introduces a new material (plywood) which is not consistent with the reinforced concrete design of this building and of the historic district generally.

4.3. Windows and Doors

The key doors at the hangars are the massive hangar doors at either end. These doors, typical of aircraft repair hangar doors from the period, appear to be entirely original and also operational. These doors should be regarded as the most important elements of the seven hangars and largely irreplaceable.

Smaller windows and doors are found on the side office wings, behind the hangar door pockets. The two-story office wings include two wide bands of steel industrial sash. The steel industrial sash generally includes 16 panes in each panel, four of which open in an awning manner. In nearly all cases, the original steel industrial sash appear to be in place and operational. **Photograph 40** shows the steel industrial sash on the second story of the east side of Building 20. Building 20 is currently in use. It will be observed that many of the windows shown in that photograph have been opened, indicating the windows are operable. Retaining operational windows is a key consideration in maintaining historic buildings in an area with the climate of Alameda Island, in which windows may be opened virtually year around.

The side office wings of the hangars also include many original steel personnel doors, two of which are illustrated in **Photograph 41**. The original steel doors included steel transoms. In

many instances, these transoms have been blocked off or otherwise modified, as shown in this photograph. While minor in relation to the scale of the building, this type of modification should be discouraged during the design review process.

Building 77, although a much different type of building, includes windows and doors that are typical of the Hangars Area, including awning-type steel industrial sash. These windows are set in elegant bands at the facade, as shown in Photographs 1 and 36. Building 77 also includes steel personnel doors, similar to those used in the hangars. The windows at the facade of this building have been modified, as discussed.

The character-defining windows and doors in the Hangar Area include:
- Immense glazed segmental hangar doors.
- Steel industrial sash with awning-type openings.
- Steel personnel doors with transoms.

Design review considerations for these windows and doors include:

- The hangar doors should be regarded as irreplaceable. These should be repaired rather than replaced.
- The hangar doors should be retained, even if they must be fixed in place.
- The steel industrial sash is very difficult to replace because few companies still manufacture it. Barring emergencies, this very durable window material should be repaired rather than replaced.
- If it must be replaced, this sash should be replaced in kind. The complex window patterns and industrial appearance cannot be replicated with fixed "picture window" type sash. The clumsy effect of this type of window can be seen in Photograph 1.

The good news from a design review standpoint is that it is demonstrably possible for the hangar buildings to be re-used without damage to the character-defining windows and doors. Building 20 was being re-used at the time this report was prepared. The side windows and doors were being used as intended, as were the hangar doors, which provide convenient access to industrial areas. The "soft" elements of these buildings are apparently quite durable and have been maintained well. The office windows, for example, all appear to be operational and are being used.

4.4. Features and Elements

The character of the buildings in the Hangars Area is defined by the strictly utilitarian approach to their design. There are few features or elements that were added to these buildings strictly for the sake of architectural embellishment. The buildings were built for heavy use and are largely devoid of applied decorative elements.

Nonetheless, some of the utilitarian elements of the buildings are noteworthy. A surprising aspect of the buildings was the extensive use of copper flashing. This copper, now aged to its

natural green patina, exists on the pent roof over the hangar doors and on the parapet of the door pockets and on the sides of the office wings. This copper is almost completely intact. In a few instances, however, the copper roofing over the hangar doors has been replaced or covered with a composition shingle roofing material, which detracts from the appearance of the building. This is true, for example, with the pent roof over the hangar doors of Building 41.

In addition, the hangar buildings include a decorative band on the door pockets and across the face of the hangar door ends, defining the bottom of the pent roof over the hangar doors.

In summary, the character -defining features and elements are few but include:

- Copper flashing and roofing.
- Decorative band at the fascia of hangar door pockets and above hangar doors.

Design review considerations are relatively few as well:

- The copper flashing is a very durable material and expensive to replace. It should be repaired rather than replaced, unless shown to be beyond repair. If replaced, it should be in copper in the geometry of the original.

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 78

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 4, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached) and re-evaluates the building. This building is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Temporary Barracks / WAVES Barracks / Apprentice Training Building

P2 e. Other Locational Data: 400 Sunrise Court on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 78 remains generally as Woodbridge described. This form provides some clarifications. Building 78 is a two-story, wood frame H-shaped building set on a concrete foundation and topped by a cross gable roof with open eaves covering 17,724 square feet. Wood vents are in gable ends. Wall cladding is horizontal wood siding and the roof appears to be covered with rolled composition. On the roof there is a small section of south facing solar panels between are two louvered dormers and one north facing dormer. The building's fenestration consists of six-over-six wood windows throughout with all of the first floor windows boarded up, and many others either boarded or with missing glass. It also appears that four of the windows in the center of the north side have been removed and replaced by horizontal wood siding.

Doors are wood panel with single lights placed throughout the building on both the first and second floors. Some are in pairs and others are single doors. All of these have boarded windows, while some door openings are boarded up. These are reached by either wood or concrete and metal stairways. A few of the doorways are covered by small shed roofs. Two small shed roof sections of the building are on the north and south sides, respectively **(Photographs 1 and 2)**.

B10. Significance:

This update form was prepared to provide additional information about Building 78, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions for the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The need for station housing increased throughout the World War II. In 1942 the Navy planned for and built five new temporary barracks on NAS Alameda. They were located south of the original east-west axis and east of the storehouses. The five temporary barracks were constructed according to the Navy's B-1 plan for H-type barracks. The Navy adopted the design for B-1 barracks at the end of World War I, and used it through 1942, across the nation. One of the five barracks built on NAS Alameda remains (Building 78), and other examples exist across the nation. Johnson, Drake and Piper constructed the semi-permanent barracks as a part of a continuing cost plus fixed fee contract. The barracks housed 300 men with laundry and latrine facilities in central area. The wood frame buildings, with either horizontal wood siding or cement-asbestos shingles, were supported on concrete piers. Central columns provided support for the sailor's hammocks.[1] These five buildings were soon altered to provide divided cubicles required for Women Accepted for Volunteer Emergency Service (WAVES), who began arriving on NAS Alameda in 1943.

The war dramatically changed the character of not only NAS Alameda's built environment, but also its workforce. During the war the station's workforce expanded to 18,000 military personnel and 9,000 civilian workers. Civilians and enlisted men comprised the bulk of the station's prewar personnel, but as more civilian men were drafted into service and stationed elsewhere, women took on an important portion of the industrial work at Alameda. Women made their way into the Navy as WAVES. Created by Congress in 1942 following the creation of the Women's Army Auxiliary Corps (WAAC), WAVES initially worked in support roles – as chauffeurs, nurses, clerks, and cooks and custodians, and later worked in training and technical roles. After initial training at Hunter College in New York City, they were stationed at naval installations throughout the continental United States, and by 1944 in Hawaii. The

first WAVES arrived at Alameda in 1943, and were given their own barracks: Building 78 (last used for applied instruction), Building 79 (demolished), Building 80 (demolished), Building 81 (demolished) and Building 82 (demolished). As at other naval installations, the role of WAVES at Alameda expanded over the course of the war, at first they were limited to support roles such as secretarial and courier duties. By war's end, WAVES were involved in aerial gunnery training, parachute packing, air traffic control, aircraft repair and other technical fields. For example, Alameda Naval Air Museum President Marilyn York was a member of the WAVES. She arrived on NAS Alameda in 1943. She initially was a driver and courier for the Commanding Officer, but then successfully got herself transferred to the Assembly & Repair Department where she did aircraft repair. Ms. York went on to a thirty year career as a civilian on NAS Alameda working on fuel control devices in Building 66.[2]

The collection of temporary barracks on the east side of the base remained in use until 1962 when most were demolished for new housing. Between World War II and that time, many of the barracks were adapted and retrofitted to provide apartments for family housing. By 1963 Building 78 had been adapted for new uses. Through most of the 1960s the building was used by the Aerial Information Center for photo interpretation. The building became classrooms through the 1970s.[3] NAS Alameda had a history of providing training both for civilians working on aircraft overhaul or other areas of the station and aviation and ground support training for military personnel. Training also occurred in Buildings 62, 101 (demolished), 116, 130 and 132 (demolished).

Evaluation

Building 78 has three possible associations with World War II: 1) temporary construction to house personnel, 2) association with WAVES, and 3) association with the NAS Alameda Historic District.

As a temporary building it is a standardized plan constructed by the Navy across the nation. These properties have been the subject of a contextual study and Programmatic Memorandum of Agreement.[4] Under the PMOA select examples of World War II temporary buildings and structures were documented or preserved as mitigation measures for the demolition of similar World War II-era temporary buildings. None of the buildings selected for documentation or preservation are located on NAS Alameda. Additional mitigation included a nationwide context of World War II temporary construction prepared by John Garner at USACE CERL in 1993.[5] Building 78 appears to qualify as a

temporary building under the PMOA and additional evaluation is only necessary to identify significance outside of its association with temporary military construction for World War II.

Standards for eligibility of temporary World War II buildings under other criteria are quite high. Buildings which have been found eligible have been associated with specific significant events within the World War II era beyond simply an association with the general war effort. The WAVES represent a distinct aspect of Navy history as an important step in gender integration. While individual barracks modified those used for men, they are not strongly associated with the development of the WAVES. Individual acceptance of women may have occurred at these scattered locations, but organizational acceptance is represented by the training centers like Hunter College and the Great Lakes Naval Training Center. Nearly every WAVE passed through these centers, and the training received reflected the Navy's policy towards women. Additionally, administrative work, like that initially conducted by WAVES on NAS Alameda, was widely accepted. WAVES working in aeronautics and other non-administrative jobs, established new patterns for gender integration within the Navy. This integration into the workplace is best illustrated by the workplace itself, not individual barracks. The WAVES barracks (Building 78) is not strongly associated with either Navy policy towards women or the new career paths created by WAVES in World War II (NRHP Criterion A / CRHR Criterion 1). Research did not reveal any individually significant WAVES associated with this building (NRHP Criterion B / CRHR Criterion 2). Association with the WAVES did not imbue the building with any additional architectural significance not already addressed by the PMOA (NRHP Criterion C / CRHR Criterion 3).

Although construction of the temporary barracks in 1942 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), the building lacks architectural significance and integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity prevents Building 78 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[6]

Building 78 was considered outside the boundaries of the district in an area altered in a manner that prevented it from conveying the appearance of the base during the period of significance (1938-1945).[7] Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the building was originally constructed during the period of significance for the historic district, it and the temporary barracks that once surrounded it were built in an area of the station that had been originally been planned for future expansion and thus the building does not contribute to the formal layout and design of the core area of the station.

CONTINUATION SHEET **Trinomial**

Page 6 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 78

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 4, 2009 ☐ **Continuation** ☒ **Update**

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Navy facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 78, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Building 78 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District.

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy Bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Building 78 was constructed as a semi-permanent class building in 1942 and thus falls within the significant time period for the NAS Alameda Historic District. Architecturally, the building is undistinguised and not representative of any particular building type on the base. Moreover, it is located in a much altered area which no longer conveys an impression of the base as it was in the period of significance. For these reasons, Building 78 does not contribute to the historic district.

Building 89 has a rectangular plan covering 1,092 square feet. It is situated between Wings 19 and 20 of Building 4. The garage building has a metal frame that supports the corrugated metal, side-gable roof, which has two round metal vents at the peak. Corrugated metal siding covers the south, east, and west sides, leaving the north side exposed with five bays separated by metal supports. Each of the bays has a nine-light, aluminum-framed windows encased by metal grills on the southern exterior; the east and west bays have two additional windows on their side walls. The westernmost bay on the north side is enclosed by a chain-link fence and the pulleys remain of the former rollup door system located along the north side (**Photograph 1**).

Period of Significance: **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

This detached garage, Building 89, is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

Building 89 is located within the boundaries of the NAS Alameda Historic District identified by Sally B. Woodbridge in 1992 as a part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" however, this building was not evaluated as a potential contributor at that time. This form provides that evaluation and does not find significance attributable to the building for activities during the World War II era that would warrant adding it to the historic district, therefore, building 89 is a non-contributor to the NAS Alameda Historic District. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building contractors Schuler and McDonald of Oakland built building 89 in 1938 as a temporary structure. Four years later, an addition was built for $2,100 which brought the area of the building to 1,092 square-feet. The building predates the nearby barracks by two years and may have been built as a storage facility before being used as a vehicle garage for the Marine Corps barracks in Building 4.[2]

Evaluation

Building 89 is located within the boundaries of the NAS Alameda Historic District identified by Sally B. Woodbridge in 1992 as a part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda"; however, this building was not evaluated as a potential contributor at that time. Although construction of Building 89 occurred during of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), it does not contribute to the significance of the NAS Alameda Historic District. The buildings considered non-contributors to the historic district were those within the district boundaries

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.
[2] Building 89, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; Department of the Navy Bureau of Yards and Docks, *Public Works of the Navy Data Book: Buildings*, July 1945, Box 232, RG#8,CEC/Seabee Museum, NBVC, Port Hueneme; Department of the Navy, Bureau of Yards and Docks, *Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume IV, Districts 12 through 14, 1963*, Box 38, RG 8,CEC/Seabee Museum, NBVC, Port Hueneme, California; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 9: The Enlisted Barracks Zone, Parcel 42, Building 89 and Open Space, Alameda Point, Alameda California," January 2001.

that were either built outside the period of significance (i.e., post 1945), those built within the period of significance that had lost integrity through alteration, or a series of "miscellaneous sheds remaining from the period of significance . . . judged not to contribute to the historic district because of their temporary nature."[3] Although not specifically listed, Building 89 is similar in form and use to the nondescript buildings listed. Building 89 did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during World War II. Research undertaken for this project in building plans and other sources indicates that Building 89 predated construction of the barracks it later served. Its placement in the courtyard of Building 4, and use of corrugated metal exterior walls and roof attests to the fact that the Navy did not intend this to be a permanent facility. Furthermore, the obscure placement of the building prevents it from contributing to the overall district appearance.

In the larger context of the naval operations in California and nationwide during this period, the utilitarian function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). This resource is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 89 is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It was not constructed in the prevalent architectural style of the historic district. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextual [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[4]

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 89, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 90 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Employment Office

P2 e. Other Locational Data: 101 West Atlantic Avenue on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 90 is a 4,552 square-foot building with a rectangular plan on a concrete foundation. It has a moderate-pitched side gable roof of composition shingles with open eaves and fascia boards on the north and south ends (**Photograph 1**). Small shed roof extensions with exposed rafter ends and knee brackets are located on the north and south ends above the personnel doors. The southern façade includes a gable roof extension over the main entrance to the building. The north and south sides also include louvered vents within the gable peaks. Fenestration includes series of six-over-six double-hung, wood framed windows: 19 on the west side, two sets on the north side, 18 on the east side, and a single window on the south side. A set of wooden stairs provide access to the north side solid wood personnel door. The south side of the building has a long wood access ramp leading up to the single metal and glazed door. The main entrance is located on the east façade with a wood and metal stair and railing leading up to the double aluminum and glazed doors (**Photograph 2**). There are two additional vents located at the base of the building on the west and south sides.

B10. Significance:

This update form was prepared to provide additional information about Building 90, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 90, constructed in 1938 by Schuler and McDonald of Oakland, was the first building constructed on the base and was used as a temporary garage building. Between 1938 and 1945, the building was relocated four times and was moved again in 1957 to its present location near the east gate. In 1947, a club for enlisted personnel opened in the building. In the 1960s the Recruitment office occupied the building and in the early 1990s the Naval Reserve Recruiting Command Detachment ONE had offices in the building.[1]

Evaluation

Although Building 90 was the first building constructed on NAS Alameda, within the period of significance for the NAS Alameda Historic District (1938-1945), the building lacks architectural significance and integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity prevents Building 90 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy

[1] US Navy, *History of the U.S. Naval Air Station, Alameda, California, 1 Nov 1940- 31 Dec 1944*, Command History 1 of 25, 1 Nov 1940-1 Apr 1947, Box 1 of 2, 5757-1b, NAS Command History, 27 Volumes, 1940-1992, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco), 6; US Navy, *History of the U.S. Naval Air Station, Alameda, California, 1 Nov 1940- 31 Dec 1958*, History of U.S. Naval Air Station, 1 Nov 1940-31 Dec 1958, Box 2 of 22, 3195 B-C, RG 181, NARA (San Francisco), 49; Building 90, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; US Navy, *1992 NAS Alameda, California Base Directory*, Box 2 of 22, 5757-1b, RG 181, NARA (San Francisco).

*Recorded by: C. Brookshear and H. Miller *Date: October 14, 2009 ☐ Continuation ☒ Update

> bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[2]

Building 90 was considered outside the boundaries of the district in an area altered in a manner that prevented it from conveying the appearance of the base during the period of significance (1938-1945).[3] Research undertaken for this project in building plans, base maps, and aerial photographs indicates that the building has been moved at least five times since construction and has been at its current location since 1957. Since 1957 the surrounding area near the east gate has been altered and no longer conveys its characteristic features.

The history of the station during the Cold War illustrates that neither Building 90, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 90, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Further, while the building retains some integrity of materials to when it was constructed, it has lost its integrity of location and no longer conveys the significance of World War II or Cold War era operations on NAS Alameda under NRHP Criterion Consideration B (for moved properties).

Building 90 is not eligible for listing in the NRHP individually, nor is it located within or a contributor to the NAS Alameda Historic District.

*B14. Evaluator: C. Brookshear and H. Norby

*Date of Evaluation: January 2010 / July 2010

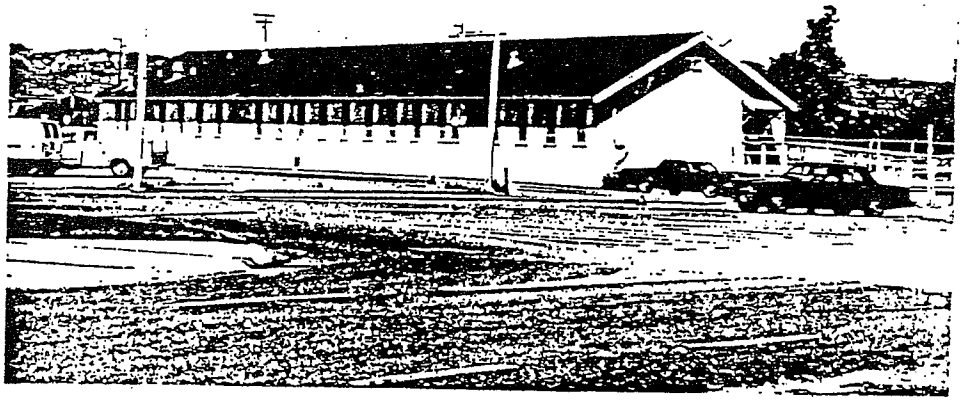
DESCRIPTION

6. Property category: District Number of documented resources: 85
7. Existing condition: a one-story, rectangular, wooden building, 132 ft. long, 34 ft. wide, and 19 ft. high; with a gable roof. Entrance doors are wooden and sheltered by pent-roofs on knee braces. Typical windows are double-hung wood sash with 4-over-4 lights. The condition of the building is good.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none



HISTORICAL INFORMATION

14. Construction date: 1938 Original location: same
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II.
19. Context: Although Building 90, constructed in the pre-war year of 1938, is one of the earliest buildings on the base, it is located in an area that has changed a great deal and no longer conveys the image of the naval air station during the period of significance. Constructed as a semi-permanent, wooden building, Building 90 is not representative of a particular type of building on the base but is more of a generic, utilitarian buidling found also in non-military settings. For these reasons, the building fails to meet Criteria A and C and does not contribute to the NAS Alameda Historic District.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 91 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Shipping storehouse

P2e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 91 is a large rectangular building set upon a concrete foundation and covering 53,223 square-feet. The building has a very low-pitched front-gable monitor roof line. Four ventilation cupolas run along the top of the monitor roof. A series of multi-paned clerestory windows run the length of the north and south sides of the extended roof. The north side of the building has a shed roof extension with exposed rafter ends and supported by square post set in round concrete supports. This extension is open to the north and provides a series of 16 open garage bays. The walls are clad in horizontal wood siding with wood corner boards. The façade, on the east side, includes a centralized set of large wood sliding doors, a smaller personnel door south of the bay doors, four sets of wood-framed, double-hung windows with hinged two-over-two central panels, and four double-hung windows (**Photograph 1**). The west side includes another large wood bay door with a small inset door in the lower south corner and a small door cut into the wall siding just south of the bay door (**Photograph 2**). North of the bay door is a grain chute structure that attaches to the monitor roof. Fenestration on the west side includes four windows similar to those on the east side. The south side contains a similar bay door and a series of 15 windows to match the fenestration in the rest of the building (**Photograph 3**). Within the garage bays located on the north side are three like windows on the east end followed by a large wood double door with ten additional windows running down to the west end of the north side (**Photograph 4**).

B10. Significance:

This update form was prepared to provide additional information about Building 91, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 91 was constructed in 1942 by Johnson, Drake, and Piper as an aircraft storehouse in support of A&R activities. Between 1943 and 1946 the same contractor added a shed roof structure along the length of the north side. At the same time a one-story building was added to the westernmost end of this addition.[1]

When originally constructed, a rail line terminated at the west entrance of the building. In 1944, a branch of the dispensary began operating a dressing station in the east end of Building 91 to augment the central treatment room located in the northeast corner of Building 5. The first aid station was established as part of a safety program to reduce injuries of the growing civilian workforce. From the 1950s to the 1990s the building was used as a general purpose warehouse and storage shed.[2]

Evaluation

Building 91 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[3] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[4] These are detailed on the attached sheets, and include wood drop siding, rooftop monitors, and wooden industrial sash windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 91, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 91 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

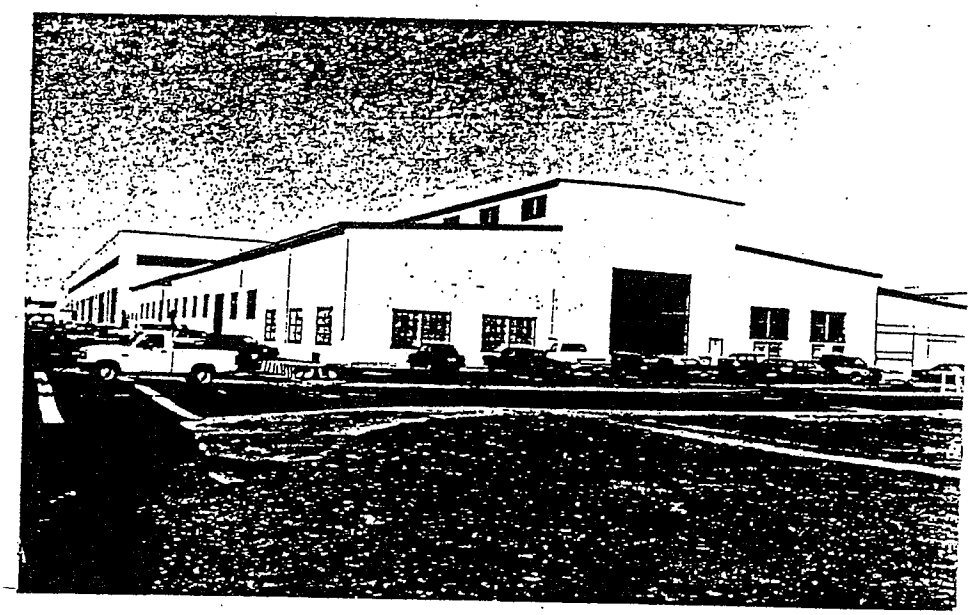
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 91, Shipping storehouse.
3. Street: Ave. F & Fifth St. **NAS Alameda Map:** O-27 City: Alameda zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. PROPERTY CATEGORY: District Number of resources documented: 85
7. Existing condition: a one-story, wood-frame building with weatherboard siding and a rectangular plan, 341 ft. long, 162 ft. wide, and 36 ft. high. The central part of the building is raised above the wings and fenestrated to light the interior. The roofs have a very slight pitch and some monitors. The facade has a very large central opening with double sliding doors. Paired metal-frame windows with 16-light hopper sash are set in the flanking wings and are used, like the doors, in the other parts of the building. A shed-roofed section was added to the north side of the building in 1944; a fenced yard occupies the space between Building 91 and 92, to the north.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none



HISTORICAL INFORMATION

14. Construction date: 1942 Original location: same
15. Alterations: shed-roofed addition to N side in 1944
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Building 91 contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1942 as part of the central core of buildings on the base. Under Criterion C, the building is representative of the type of semi-permanent wood structure that is common on the base. An addition to the N side dates from 1944, within the period of significance; the building is otherwise unaltered and in good condition. It is associated with Building 92 to the north.

20. Sources: NAS Alameda records

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 5 ***Resource Name or #** (Assigned by recorder) Building 92

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 8, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 92 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Packing/Shipping facility

P2 e. Other Locational Data: 650 Ranger Avenue; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 92 has a rectangular plan covering 89,018 square-feet, and is set upon a concrete foundation. A slightly gabled monitor roof tops the building in an east-west orientation with vent copulas along the ridge. The walls are clad in horizontal, toe-grooved wood siding. Fenestration along the building includes pairs of four-over-four wood-framed windows with four operable lights. Similar fixed windows run along the length of the clerestory. The south side of the building includes four metal overhead doors inset with metal personnel doors and flanked by windows (**Photographs 1, 2**). The north end is similar to the south end with the addition of a shed roof extension, which currently houses a bike shop (**Photograph 3**). A series of square posts support the shed roof and two-part hinged garage doors provide access on the north side. The east and west ends are similar; characterized by four 16-light windows above a central two-part vertical wood, bay delivery door, which is flanked by four additional sets of windows (**Photographs 1 and 4**). The west side also includes a caged metal stair that provides access to the roof.

B10. Significance:

This update form was prepared to provide additional information about Building 92, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors, Johnson, Drake and Piper constructed Building 92 in 1942 as a semi-permanent supply aircraft storehouse to support A&R activities. A rail line was located through the building, which now ends before the eastern entrance. Between 1944 and 1946 a lean-to shed roof structure was constructed at the center of the north side of the building. Between 1945 and 1953 the function of the building changed to a supply, packaging, and shipping building. From the 1960s and onwards the building was used as general warehouse and storage space. [1]

Evaluation

Building 92 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[2] The contributing elements of the district each retain adequate historic

integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[3] These are detailed on the attached sheets, and include wood drop siding, rooftop monitors, and wooden industrial sash windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 92, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 92 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

County: Alameda code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a one-story, wood-frame building with weatherboard siding and a rectangular plan 480 ft. long by 181 ft. wide by 34 ft. high. The roof has a very slight double pitch and monitors. The central section is raised above the lower wings and is fenestrated to light the interior. The symmetrical facade has high double doors in the center, above which are grouped 4 metal-framed windows with 16-light hopper sash. These standard windows are paired for the rest of the building; the same doors are also used. A fenced storage yard occupies the space between this building and Building 91 to the south.

HISTORICAL INFORMATION

14. CONSTRUCTION DATE: 1942. ORIGINAL LOCATION: same
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Building 92 contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1942 as part of the central core of buildings on the base. Under Criterion C, the building is representative of the type of semi-permanent, wood-frame construction that is common on the base and is unaltered and in good condition.

20. Sources: NAS Alameda records

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 7 ***Resource Name or #** (Assigned by recorder) Building 94

***Recorded by:** C. Brookshear and M. Bunse ***Date:** September 25, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 94 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Chapel

P2 e. Other Locational Data: 2790 Saratoga Street on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The chapel has an irregular plan measuring approximately 118 feet by 43 feet and containing 9,180 square feet. The building is covered with a complex system of hip roofs over building portions ranging from one to three stories. The roofs are covered with composite shingles and the walls are sheathed in horizontal wood boards placed flush with each other to create a smooth surface. The building is divided into a narthex at the west end and apse with tower at the east end. The nave between the two is narrower than the other portions. South of the nave between the narthex and apse is a large covered entry area.

The narthex is a single story at the western end of the building. The south side has a concrete stair to a pair of solid wood doors sheltered by a shed roof with knee braces. The west end of the narthex has a block of four rows of seven horizontal fixed windows individually recessed into the wall. The windows are glazed with textured glass. Stairs offset to the north lead to a pair of solid wood doors set flush with the wall. The north side of the narthex has three windows and a single wood door evenly spaced along the side. The windows are two over two wood double hung with wood trim. The door, located to the east of the windows, has a concrete stair with concrete sides. The solid wood door has a transom. A single two over two window is located on the east side north of the nave.

The nave is approximately two stories in height containing a tall single story. The north side has minimal ornamentation consisting of three banks of horizontal fixed windows recessed and evenly spaced in the wall in three by seven vertical groupings. The groupings are located in the upper level of the wall. A similar group of windows is located on the south side. The south side of the nave also has a single story porch along the full length of the nave. The flat porch roof is supported on square wood posts. A pair of solid wood doors leads directly into the nave from the porch. A second set of double doors leads from the porch into the apse. The porch is deeper towards the west providing additional coverage to the approach.

The apse is located at the eastern end. In the center of the apse where it joins the nave is a three story tower. The tower has a hip roof with a cross on the top. The north, east and south sides of the tower have groupings of horizontal windows evenly spaced and recessed into the wall. The windows are grouped in three columns seven windows tall. Surrounding the tower is a single story apse with hip roof. The south side of the apse has three evenly spaced windows which have been boarded up. The east side has four evenly spaced windows. Three are evenly spaced pairs of two over two double hung wood frame windows. A single two over two wood frame window is placed between the northern pair and the southern two pairs. The east end of the north side is set back approximately two feet from the west end. The western portion has a single flush solid wood door and a pair of two over two wood frame double hung windows. The eastern portion has a recess containing a single door with five horizontal lights and a door to an equipment closet. A single two over two wood frame window is located west of the recessed door.

The Chapel's interior was renovated multiple times in the 1960s and 1970s. Although these renovations included the installation of stained glass windows and wood paneling, the building retains the original plan within the sanctuary (**Photographs 4, 5**). The building is characterized by a large open sanctuary with an inset altar. The Navy altered the rest of the chapel extensively through its history.

B10. Significance:

This update form was prepared to provide additional information about Building 64, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors, Johnson, Drake and Piper constructed the Chapel in 1942 as a semi-permanent building. They broke ground on September 15, 1942 and the completed Chapel was dedicated on April 11, 1943. The Chapel was divided into two separate chapel spaces, the Main Chapel and the Roman Catholic Blessed Sacrament Chapel. Before completion of the building, services were held in the Station Theater (Building 18). In 1945 the Shannon Chapel was

constructed at the west end of the building adjoining the Main Chapel and was dedicated on October 28, 1945. It was used primarily for small weddings, evening vespers, weekday services, and to enlarge to capacity of the Chapel from 400 to 652 for holiday services with the use of an accordion door. In the late 1950s a Roman Catholic and two Protestant chaplains served the Station.[3]

During the late 1960s the Chapel was refurbished and stained glass windows were installed in the Shannon and Blessed Sacrament Chapels. In the early 1970s a Self-Help project was responsible for renovating the Station Chapel by remodeling the Chapel offices and entrance door, and converting the Shannon Chapel into a fellowship hall with a kitchen. In 1979 architectural firm Lewis and Schnieder, ALA designed a three-phase Chapel renovation carried out by Construction Battalion Unit 416. The first phase included building and hanging redwood screens on the sanctuary walls. Walls and ceiling were stripped in the Blessed Sacrament Chapel in the second phase for the installation of new fireproof materials that were then covered with hand-placed tongue-and-groove redwood strips. Two new stained-glass windows, created by William Baker, a retired naval aviator were installed in the Blessed Sacrament Chapel. A third stained-glass window, also by Baker, was slated for installation after a dedication ceremony and a fourth smaller window, salvaged from the USS Orinskany after decommissioning, was also installed. Installation of redwood wall paneling and a new pulpit and lectern in the Main Chapel completed the third phase.[4]

In terms of the number of services provided to the Station, 416 Catholic masses, 61 Protestant services, 4 Ecumenical services, and 10 Jewish services were held in 1973. The chaplains conducted 42 weddings, 16 funerals, 11 memorial services, 75 baptisms, 68 first communions, and 1,986 personal interviews and counseling sessions with military personnel and dependants the same year.[5]

Evaluation

Building 94 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[6] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[7] These are detailed on the attached sheets, and include smooth horizontal board

surfaces of the building, hip roofs, emphasizing vertical elements, original two over two windows on the north side. The emphasizing vertical elements consist of 'stacked' groupings of windows in the tower, upper levels of the nave and at the west end of the narthex. The 1997 "Guide" indicates that the art glass windows are character-defining features, research indicates that these were added after the period of significance.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period.

Building 94, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 94 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

Zip: 94501 County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel: none

DESCRIPTION
6. Property category: District Number of resources documented: 85

7. Existing condition: a concrete building, 118 ft. long and 43 ft. wide, with an irregular T-plan composed of several elements which culminate in a square tower at the E end with a hip-roof surmounted by a cross. The hip-roofed nave rises above a one-story ground floor with a separate hip-roof that skirts the nave on the W end and the tower on the E end. The main entrance with double wood doors is on the S side of the chapel. A covered walk extends along the middle section of the S side from the entrance. The tower, nave, and W wall are fenestrated with vertical rows of small rectangular windows, 3 to a side in the case of the tower, and set in groups of three across and seven down on the nave walls. Other typical windows are paired and metal-framed with 4-light hopper sash.

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: The Chapel, Building 94, contributes to the NAS Alameda Historic District under Criterion A because it was built in 1943 as an addition to the early core of buildings on the base. Under Criterion C, the design reveals an intention to create a more traditional image for the chapel through the use of a hip-roof and hierarchical massing combined with a cubistic composition and other details such as the gridded windows. The chapel also retains a high degree of architectural integrity.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

3.7. Character-Defining Elements of Building 30 and 31.

Buildings 30 and 31 were literally "gateway" buildings for the NAS Alameda and, for this reason, were given a degree of attention not commonly found in utilitarian buildings of this sort. The two buildings, along with the original gate posts to the east, were clearly designed as a group and are consistent with the design theme for the historic district. Building 30 is shown in **Photograph 33**. Among the character-defining elements are:

- Smooth concrete surface.
- Flat roofs with broad, sweeping concrete canopies.
- Characteristic oval columns, supporting the broad canopy.
- Sympathetic aluminum two-over-two double-hung sash.
- Cast stone eagle and flag figure on Building 30.

3.8. Character-Defining Elements of Building 60.

Building 60 -- the Officers' Club -- is the most heavily modified building within the historic district. The building offers strong evidence of the impact of replacement of the impermanent parts of a building, chiefly its windows and doors. While the basic form of this handsome building remains, the loss of the original windows and doors diminishes its architectural and historical importance. It now has a frankly modern overall appearance, owing to the replacement of the "soft" elements. Key character-defining elements include:

- Rounded main room at the facade, shown in **Photograph 34.**
- A few remnant original windows, including stacked windows in the rear patio area and to one side of the facade.

3.9. Character-Defining Elements of Building 94.

Building 94, the Chapel for NAS Alameda, was built during the middle of World War II, when concrete was scarce. Although a highly prominent building, it was built of wood, with a flush horizontal board siding, probably with a shiplap joint. This wooden siding appears to be in excellent condition. It was also fitted with a series of hipped roofs, also unique within the Administrative Core and within the historic district generally, except for the quarters, which also have hip roofs. Among the key character-defining elements for this building are:

- Board siding.
- Original double-hung, two-over-two windows on the north wall.
- Art glass windows in the chapel area.
- Stacked openings in the belfry.

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 98

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 98 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Barrel Shed

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 98 is an 11,562 square-foot, rectangular building on a concrete foundation. It has a shed roof with the high side on the west side. The walls are clad in simple drop-lap, horizontal wood siding with matching corner boards. The north side includes a metal overhead door with an inset solid metal personnel door on the east side **(Photograph 1)**. The east half of the north end is enclosed by a chain-link fence that wraps around to the east side. The west wall has eight evenly placed metal framed, reinforced glass windows with a centrally placed overhead door similar to the one on the north side. The south side also has a similar overhead door located on the west end **(Photograph 2)**. The east end includes nine-fixed, single pane windows, the last two of which are above a small utility shed. The shed has a shed roof and matching horizontal wood siding. The east side of Building 98 includes a five-bay wooden addition. The north wall of the addition has two groups of three boarded up windows on its east side. On the main building's east side are two vents located in the top third of the building **(Photograph 3)**.

B10. Significance:

This update form was prepared to provide additional information about Building 98, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station operated vital functions during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The

design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.
