The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the station's original design axial and formal layout. In 1941, the Navy began construction of Building 13. In 1942, four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building 98 was constructed by Johnson Drake and Piper as a Barrel Storage Shed.[4] It served as a storage facility during World War II and the Cold War. In 2001 the building served as the centralized hazardous waste accumulation point.[5] Alterations to windows and doors have been made in the intervening years.

History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

Evaluation

Building 98 was constructed in 1942 and reached its current configuration by 1945. Although construction of the Building 98 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), the building lacks architectural significance and integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, lack of historic integrity to the period of significance and the utilitarian building style prevents Building 98 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-
> contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[6]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 98 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and considerable post 1945 construction. These factors prevented the area from conveying the appearance of the station during the period of significance (1938-1945).[7] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, paint / oil storage, barrel storage shed (Building 98), and engine test cells. Research undertaken for this project in building plans, station maps, and aerial photographs indicates that this area was not a part of the original formal station plan. This area appears to have been designated for hazardous materials and future expansion. Expansion in this area did begin during World War II, but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District.

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air

stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 98, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 98 performed standard storage functions found throughout the Navy.

Building 98 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Ordnance Operations Building

P2 e. Other Locational Data: 1280 West Midway Avenue on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete foundation, Building 102 has a rectangular plan and is clad in horizontal wood paneling with a flat roof. A concrete walkway leads to the main entrance on the north side of the building. Concrete stairs lead to a recessed wooden door with a single pane of glass; the door is flanked by three-over-one sidelights. Fenestration includes a pair of four light wooden windows. The east has a pair of four-light windows, three one-over-one ribbon windows, and a recessed entryway with wooden door and single-pane window (**Photograph 1**). The west side has three sets of four-light wooden windows. The south side has a four-light wooden window and two smaller one-over one wooden windows. A metal, exterior ladder is attached to the southwest corner of the building (**Photograph 2**). The 1992 report notes a decorative "NAS WEAPONS" metal sign, painted torpedoes surrounding the main entrance, and an iron chain fence with two metal shell casings, however all have been removed. The concrete foundations for the painted torpedoes remain, flanking the sidewalk at the base of the entry stairs (**Photograph 3**).

B10. Significance:

This update form was prepared to provide additional information about Building 102, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Johnson, Drake, and Piper constructed Building 102 in 1943 as a semi-permanent ordnance office near the northwest corner of Building 5. Building 102 was part of the Weapons Department as the Ordnance Operations Building. The mission of the Weapons Department in the 1970s was the procurement, receipt, storage, maintenance, and issue of all weapons, ammunitions, and explosives authorized for use in the support of Fleet units and tenant activities on the Station. Additional duties included operating the pistol firing range, the Station Armory, providing weapons for transshipment services and facilities, maintaining the Station Saluting Battery and rendering gun salutes as directed, and coordinating explosive ordnance disposal.[1]

Evaluation

Building 102 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[2] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[3] These are detailed on the attached sheets, and include smooth building surface, steel industrial sash windows, and curved concrete entry canopy.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 102, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 102 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

I. & 2. Historic/Current name: Ordnance Building 102
3. Location: NAS Alameda map M-20
City: Alameda Zip: 94501 County: Alameda Code: 001
4. UTM zone: Oakland West, CA, A B C D
5. Quad map No.: N3745-W122215 Parcel No.: none

DESCRIPTION

6. Property category: District Number of documented resources: 85
7. Existing condition: a one-story, wood-frame building clad in weather-board siding with a flat roof and a rectangular plan, 51 ft. long x 38 ft. wide x 12 ft. high. The entrance is recessed within a plain, rectangular entryway raised by five steps and centered in the facade. The wooden door has a single light in the upper part and is flanked by wood panels with three lights each. On either side are typical windows, which are paired double-hung wood sash in wood frames. The entrance walk in front of the building has two torpedo shells, painted with stars and stripes and topped with glass lamps, which
carry an openwork metal sign between them with "NAS WEAPONS" in metal letters. A fence of metal posts with pointed tops supporting iron chains runs out to the sidewalk and ends with two shell casings.

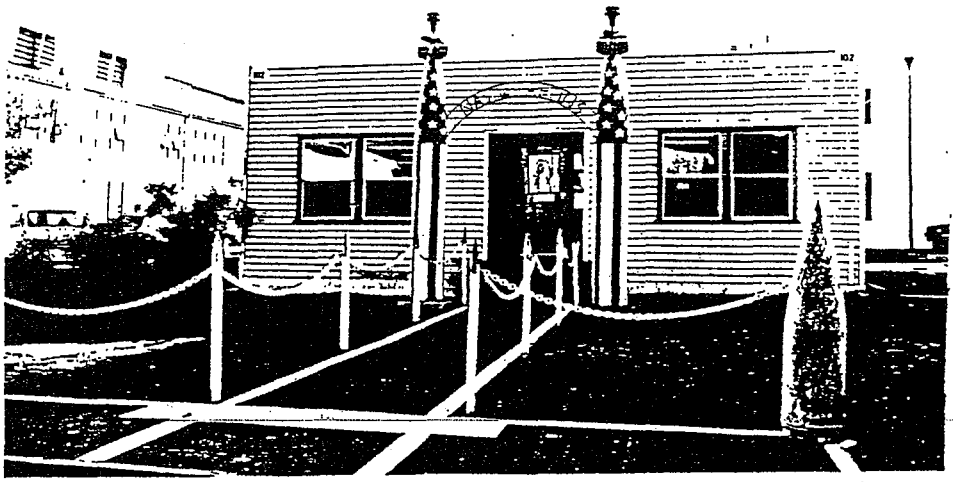
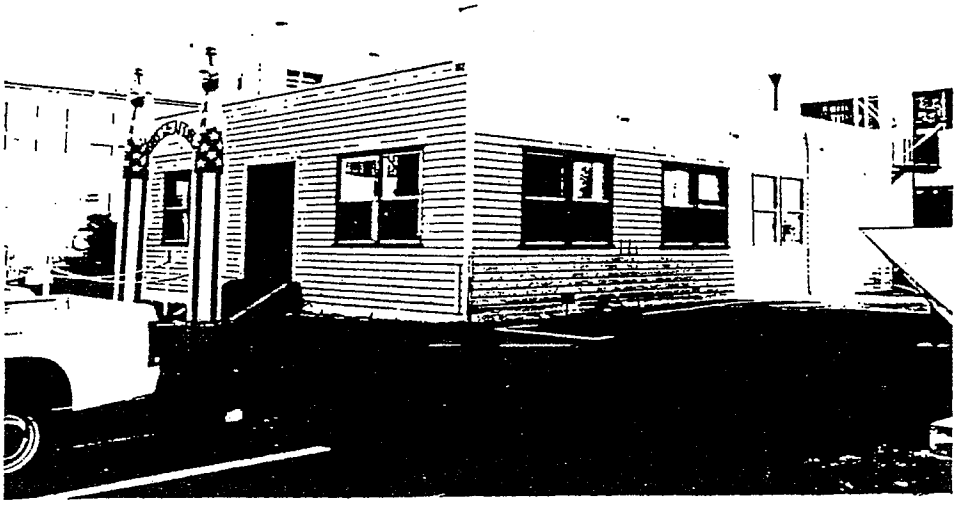
13. Threats: none



NAS ALAMEDA Building 102



HISTORICAL INFORMATION

14. Construction date: 1943 Original location: same
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: Military property - 34.

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period:1938-1945
Property type: District Context formally developed: yes

19. Context: Building 102 contributes to the historic district of the NAS Alameda under Criterion A because it served as an ordnance building for the naval air station during the period of significance for the historic district from 1938 to 1945. This period encompasses the broad theme of the mobilization for and operations during World War II. Constructed as a semi-permanent structure, the building, which is unaltered, is representative of the type of straightforward wooden architecture that was typical of naval bases in the San Francisco Bay Area.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 112

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 112 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Building 112

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete foundation, Building 112 is a 288 feet by 100 feet wide rectangular wood frame building clad in horizontal wood siding with a low pitched gable roof covering 33,657 square feet. The west side has a centrally located two-part sliding door and a metal personnel door to the south. Fenestration includes two pair of two-over-three double-hung wood windows on the south end and a pair of two-light horizontal windows on the north end, one of which is boarded over. The south side has thirteen sets of two-over-three double-hung windows. The southwest end has a boarded over personnel entry, a wooden double door replacing a sliding wood door, a single sliding wood door, a wood door with four-lights above, a two-part sliding wood door and a single wood personnel door at the east end. Building 337 is located at the southeast corner of the building **(Photograph 1)**. The east side has a centrally located overhead door and a wood personnel door to the north **(Photograph 1)**. Access to the north side was restricted **(Photograph 2)**. The north side has seven boarded up window groups and two and two full length sliding door openings that have also been boarded up. A personnel door is located at the far east end.

B10. Significance:

This update form was prepared to provide additional information about Building 112, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[2] Similar to efforts made by the Army, the Navy adopted this master planning approach to

[1] "1960s Oblique Aerial," RG 181, 3195B-C, Box 21 of 22, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).

design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[3] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [4] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the station's original design axial and formal layout. In 1941 the Navy began construction of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Contractors Cahill Brothers of San Francisco constructed Building 112 as a semi-permanent salvage transit shed in 1944. The building was used for storage, packaging, and shipping. Structurally the building appears unaltered since the 1960s **(Photograph 3)**. [5]

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements

of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[6]

Evaluation

Building 112 was part of the original period of construction on the station, and falls within the period of significance of the NAS Alameda Historic District (1938-1945). Although Building 112 has some association with the district's significance under NRHP Criterion A (CRHR Criterion 1), the alterations to the area of the station where the building is located prevent it from conveying its association with the World War II context. Furthermore, Building 112 is an undistinguishable example of a common building type and does not convey any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[7]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 112 was placed in the latter category because the area where the building is located was so altered through multiple changes over time that it no longer conveyed the impression of the early air station and did not contribute to the district. Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, storage (like Building 112), and engine test cells. Research undertaken for this project in building plans, base maps, and aerial photographs indicates buildings that this area was not a part of the original formal station plan and that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[8] It is

also within an area of the station that includes buildings that have been relocated, altered, and newly constructed during the Cold War period. The area, which includes Building 112, therefore, does not convey its association with the context of World War II naval facilities in the Bay Area, and is not a contributing element of the historic district.

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[9] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Individual buildings constructed during World War II, or World War II era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 112 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War eras. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 112, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Although the building retains integrity to its period of construction, it was unremarkable in its use on NAS Alameda.

Francisco); JRP, "The History and Historic Resources of the Military in California, 1769-1989," 6-22, 6-23; H.C. Sullivan, "Base Planning," *Civil Engineering Corps Bulletin* (April 1947): 118-122.

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

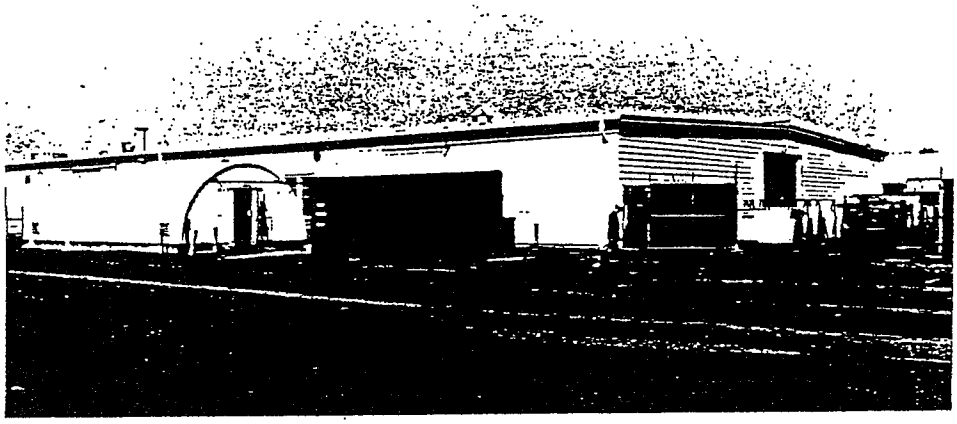
1.& 2. Historic/Current name: Building 112, Packing/Storage
3. Street: Ave. G, NAS Alameda Map Q-29 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION

6. Property catefory: District Number of resources documented: 85
7. Existing condition: a one-story, wooden building clad in weatherboard siding with a nearly flat gable roof and a rectangular plan, 462 ft. long and 200 ft. wide. Doors are typically double and slide on tracks; windows have double-hung wood sash with 6-over-6 lights in wood frames.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none

NAS ALAMEDA Building 112



HISTORICAL INFORMATION

14. Construction date: 1944. Original location: yes
15. Alterations: minor exterior alterations to openings
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Although Building 112 was constructed in 1944 during the period of significance, it is located in an area that has changed and no longer conveys an impression of the early air station. Architecturally, the building is a utilitarian structure of the semi-permanent class and is not particularly representative of any type on the base; rather it is broadly related to large wooden industrial sheds that occur in a variety of settings. For these reasons, it does not meet Criteria A or C and thus does not contribute to the NAS Alameda Historic District.

B10. Significance:

This update form was prepared to provide additional information about Building 113, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of

O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70.

formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars.[3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the original design axial and formal layout. In 1941 the Navy had constructed the initial portion of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building 113's 60 x 120 foot frame was purchased second hand at the cost of $114,128 in 1943 and erected on NAS Alameda by the Independent Iron Workers of Oakland.[4] It was used as an aircraft salvage and reclamation shop as part of the Overhaul Control Division (**Photograph 3**).

Photograph 3: Circa 1943 west side view of Building 113.[5]

In 1948 the building was moved in three sections to a location 300 feet west from its previous location (the present location of building 398) to act as a temporary shelter for jet engine overhaul. The cost to relocated, furnish, and install jet overhaul equipment was $78,800.[6] As a jet reaction engine shop, Building 113 had five shops within

including: disassembly jets, zyglo inspection, cleaning shop, metal shop, and machine shop.[7] In the 1970s the San Francisco Fleet Maintenance Assistance Group (FMAG) had a gun/fire control shop located in the northwest corner of the building.[8]

Evaluation

Building 113 was constructed in 1943 and relocated in 1948. Although construction of the Building 113 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District, the building lacks architectural significance and integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity and utilitarian building style prevents Building 113 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original district boundaries were drawn to include areas which were a part of a formal station plan and shared architectural similarities. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[9]

Building 113 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and considerable post-1945 construction. These factors prevented the area from conveying the appearance of the station during the period of significance (1938-1945).[10] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the locomotive repair shop, paint / oil storage, engine test cells, and aircraft shops (Building 113). Research undertaken for this project in building plans, station maps, and aerial photographs indicates that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[11] Expansion in this area began

during World War II, but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. In addition, even though Building 113 retains integrity of design, it was moved, which further disrupts the integrity of the area. This movement occurred after the period of significance (1938-1945) and Building 113 does not meet the standards to be considered eligible as established under NRHP Criteria Consideration B.

The history of the station during the Cold War illustrates that Building 113, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[12] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 113, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 113 performed standard aircraft maintenance activities found throughout the Navy.

Building 113 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 7, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 114 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: PW Office-Maintenance Shop

P2 e. Other Locational Data: 801 W. Ranger Avenue; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 114 is an irregular U-shaped building with two setbacks in the southwest and northwest corners. The building covers 76,895 square feet. It has a flat parapet roof, horizontal wood siding, and a concrete foundation.

South Wing: The south wing is two stories and rises to two and a half stories at the west end. The east end of the south wing has five pairs of six-light wood framed windows along its second story. The first floor has three shed roof door shelters and a gabled shed roof addition at the south end. From north to south the roofs shelter a set of double doors, a single door with a set of six-light windows adjacent to it, and a double door attached to a boarded up window opening (**Photograph 2**).

Beginning on the east end, the south side has an exterior metal staircase leading to a second story metal personnel door with attached six-light window. A pair of six-light windows follow on the second story above a boarded up doorway and windows. A building seam separates the building and is followed by two sliding windows on the second story and a single personnel door and adjacent boarded up window opening. A second building seam precedes the metal roll-up door with inset personnel door. The majority of the side is characterized by eleven double sets of four-by-seven windows spanning both stories. These irregularly spaced windows are interspersed with single metal personnel door and narrow boarded up window opening separate the sixth and seventh window bays. The seventh window is followed by a sliding door with four-by-four panels of which the top panels are glass. A personnel door separates the last window from the others. At this point the height of the building extends upward and this section is characterized by six wood framed two-over-two windows on the second story and two sets of three-by-three paired windows set in wood frames on the first floor.

The east end of the north side has a northward extension (**Photograph 3**). This section of the building is characterized by four-by-three windows interspersed with personnel doors with transom windows. There is a shed roof addition at the northeast corner of corrugating metal with a corresponding sliding door. Sliding doors are located on the north and west sides of the extension. The main section of the building is characterized by multiple shed roof additions of corrugated metal, which often shelter personnel entrances and windows. Fenestration includes both four-by-three and three-by-three wood framed windows interspersed among the sliding and personnel doors. Two of the sliding doors are wood paneled with inset personnel doors and the top row of panels is glazed. The third sliding door has the series of glazed panels but lacks the personnel door. Most of the individual personnel doors include transom windows. The western end increases in height and has a row of five wood framed, double hung windows in its second story. That corner also has a set of double metal personnel doors.

Southwest corner of the building has two setbacks, the first of which is two window bays deep and the second spans four window bays (**Photograph 4**). These setbacks are characterized by two-over-two wood framed windows. The first setback has a single metal personnel door on the second floor accessed by a metal exterior stairwell.

West Wing: The west wing of Building 114 is two stories high and characterized by rows of wood framed, double hung windows on both floors (**Photograph 5**). The centralized main entrance is recessed within a shed roof extension supported by square wood posts. The entrance includes metal framed, glazed double doors flanked by fixed and transom lights.

The east side of the west wing is characterized by 15 double hung windows and three replacement casement windows and a centrally located metal louver vent all along the second story (**Photograph 6**). The first floor includes two-over-two windows interspersed among double metal personnel doors and single wood personnel doors, two of which have shed roof overhangs. Adjacent to one of the personnel doors is a set of mechanical equipment which extends up to the second floor. The north end of this side includes two small, boarded window openings.

Northwest corner of the building has two setbacks, the first is two window bays deep and the second is a series of six side by side windows deep (**Photograph 7**). The setbacks include rows of two-over-two wood framed windows on the first and second stories. The first setback also includes a metal exterior stairwell that leads to a metal personnel door on a second floor. The first floor has a metal personnel door, with a square transom window, in the corresponding location.

North Wing: The west end of the north wing is characterized by two-over-two wood framed windows along the second story and two pairs of nine light windows on the first floor (**Photograph 8**). An exterior metal staircase leads to the metal and glazed personnel door beneath the shed roof extension. The main section of the building lowers in height and includes a large series of pairs of four-over-seven wood framed windows interspersed with paneled sliding doors. The eastern section includes a divided paneled and glazed sliding door flanked by pairs of four-over-five wood framed windows.

The east end includes a flat roof, concrete addition. This has a central sliding door with inset personnel door and six five-over-four fixed windows. The addition also has a large metal pipe extending from the roof of the building.

The south side of north wing has a southern extension at its east end (**Photograph 9**). This section of the building is includes pairs of three-over-two and four-over-two wood framed windows among mostly boarded up personnel entrances. A large sliding door remains to the west with two-over-three glazing. The east end of the extension includes a second story window and fire escape platform. The west side of the extension includes large metal dust collector machinery, a small sliding door, and a three-by-three window. Fenestration along the main section of the south side includes three-by-four, three-by-three, three-by-five- and five-by-four windows with wood frames (**Photograph 10**). There are also four wood personnel doors, two with transoms, and one with a louver vent. Additionally, there are two boarded up former personnel door openings. This side has three sliding doors, two are metal and one wood with boarded up top panels. The west end of the wing rises to include five two-over-two windows in its second story.

B10. Significance:

This update form was prepared to provide additional information about Building 114, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Stolte, Inc. of Oakland constructed Building 114 in 1944 for a total cost of $246,621.23. This building housed the Public Works office and served as a maintenance building. Building 114 was part of the original station plans for NAS Alameda developed in 1939. The original building plans included a variety of maintenance shops along the first floor in the eastern portion of the building. The western end of Building 114 was divided into offices and supply rooms, and the second floor consisted of a series of smaller offices and storage rooms. In 1967, the main entrance to

CONTINUATION SHEET **Trinomial**

Page 9 **of** 10 ***Resource Name or #** (Assigned by recorder) Building 114

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 7, 2009 ☐ **Continuation** ☒ **Update**

Building 114 was modified. This included the addition of wood-framed transom windows around a double door entry, this has since been changed to the metal-framed entrance currently on the building. Building 114 saw more unspecified alterations in 1991, which were likely internal changes since the building retains its original footprint and many of the windows and door appear to be original.[1]

Public Works included seven divisions including Administration, Engineering, Maintenance Control, Housing, Maintenance, Utilities, and Transportation. The Public Works Department was in charge of the design, construction and maintenance of public works project and utilities. This included material handling equipment, aircraft support equipment and the public units within the East Bay Navy Family Housing Complex. By October 1944 many of the shops within Building 114 were operable including a typewriter shop and a time keeping section. In addition, Public Works provided advanced courses in pipefitting, sheet metal and electrical instruction. In general, Public Works programs included base expansion measures, for example the 1952 runway modifications and new construction of the engine overhaul and repair shop were funded and run by the Public Works Department.[2]

In the late 1960s, efforts to consolidate areas resulted in the relocation of offices and shops into Building 114. The Housing and Maintenance areas closed their lawn mower shop and relocated the facilities into the Master Tool Room within Building 114. By 1968 the Wage and Classification and Special Programs Division and Employment Division has staff located within Building 114 as well as dispersed elsewhere on base. The Environmental Protection/Ecology Office was established in 1971 and was located in Room 203 of Building 114 as of 1979.

Restructuring on base dramatically increased during the 1970s and 1980s. By 1973 Public Works was one of the departments affected by the Shore Establishment Realignment, which reduced personnel ceilings in non-tenant operations. Following this change, the Public Works Department became the Public Works Center San Francisco Bay, which serviced for several Naval Facilities in the bay area. While Public Works continued to dominate Building 114, a few additional departments were moved out of the building beginning in the mid-1980s. In May 1985, The Naval Legal Services Office Detachment relocated from Building 114 to Building 1. Additional renovations to Building 1 resulted in the Environmental Office moving from Building 114 in 1993. The recent building card designates four major divisions within Building 114, which continued to be dominated by Public Works facilities. As of 2008, the Public Works Office and Maintenance Shop included a 2,127 square-foot office equipment and repair shop, a 30,606 square-foot public works shop, 29,568 square-foot public works maintenance storage, and administrative offices covered the remaining 14,594 square-feet.[3]

Evaluation

Building 114 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the building were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[5] These are detailed on the attached sheets, and include wood drop siding, flat roof, horizontal orientation, steel industrial sash and remaining wooden sash windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 114, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 114 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORICAL INFORMATION

14. Construction date: 1944 Original location; yes
15. Alterations: minor exterior alterations to openings
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic Attributes: military property - 34

SIGNIFICANCE AND EVALUATION

19.Theme: The development of U.S. Navy bases in the S.F. Bay area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Building 114 contributes to the NAS Alameda Historic District because it was built in 1944 as part of the central core of buildings and has served as the Public Works facility since that time. Under Criterion C, the building is represectative of the utilitatian, semi-permanent class of buildings that is common on the base and, despite some exterior alterations, retains a high degree of integrity. The building is also located in an area that retains a strong impression of the naval air station during the period of significance.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 115 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Ambulance Garage

P2 e. Other Locational Data: 2601 Todd Street; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete slab, Building 115, measuring 2,784 square feet, has a rectangular plan clad in drop wood siding with a flat parapet roof with metal coping at the top of the parapet walls. The south wall is plain. The east wall has six one-car garage bays with replacement roll up doors facing Todd Street (**Photograph 1**). To the north is a group of three two-over-two double hung wood windows with a three light wooden door with a shed roof wooden porch with wooden posts at the north end (**Photograph 2**). The north wall a pair of two two-over two double hung wood windows with two small louvered vents above (**Photograph 3**). The west wall has two replaced wooden personnel doors with a wooden shed roof porch and wooden braces. Fenestration includes a boarded up window with louvered vent above, and five single pane wood hopper windows with four louvered vents below (**Photograph 4**). All doors and windows are wood framed.

Photograph 5: 1945 photograph of Building 115.[1]

B10. Significance:

This update form was prepared to provide additional information about Building 115, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Johnson, Drake and Piper constructed Building 115 in 1944 as a semi-permanent ambulance garage to serve the adjacent Dispensary (Building 16). It continued with its original use until the 1970s when it was relegated to a vehicular garage. More recently is has been used for office and storage space. [2]

Evaluation

Building 115 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[3] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 115 was recorded by the previous studies (attached).

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 115, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 115 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

***Recorded by:** C. Brookshear and M. Bunse ***Date:** September 25, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 116 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Rehabilitation Center

P2 e. Other Locational Data: Fourth Street and Avenue C on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 116 is a one-story building with a roughly "I"-shaped footprint covering 7,178 square feet. The building has a flat roof with a metal flange. The building has horizontal wood siding with horizontal grooves, and rests on a board-formed concrete foundation. There are small rectangular louvered vents in the parapet and the concrete foundation. On both the north and south sides of the building there are nine, wood two-over-two evenly-spaced windows.

A small central wing between the north and south wings distinguishes the west side of the building. On the north wing, there are three windows – one permanently boarded up and two temporarily boarded up. On the west face of the northern wing, there are wooden stairs leading to a small porch and a single, boarded-up door. Above the door is an asphalt roll shed roof supported by a knee brace, and adjacent to the door is a single, boarded up window. On the south face of the northern wing, there are three one-over-one wood-frame windows. The southern wing of the west side is similar to the northern wing, with the three one-over-one wood-frame windows appearing on the wing's north face. In the central wing, there are two windows on the south face and one window on the west face; on the north face, wooden stairs lead to a solid wood door. Between each of the three wings, there are four one-over-one wood windows – all of which are boarded up.

On the east side of the building, the features of the northern and southern wings are identical to the features on these wings on the west side of the building. The east side lacks the small central wing that can be found on the west side. Instead, there are three pairs of two-over-two wood frame windows centrally located. On either side of the three pairs of windows are two pairs of panned window doors covered with a shed roof supported by a knee braces. Wooden stairs led to both of these doors.

B10. Significance:

This update form was prepared to provide additional information about Building 116, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Johnson, Drake and Piper constructed Building 116 in 1943 as a semi-permanent barracks for corpsmen. Between 1943 and 1950 the building was classified as a lecture hall and courses held included an intelligence course for combat training of Officers and Enlisted Men and Photo Interpretation. An Apprentice School was housed in the building until it relocated to Building 101 in March 1950. In the 1960s the building was used as a driving school. In 1964 the Bureau of Naval Personnel began funding a high school driver education program for young military personnel who did not have the opportunity to take drivers training before entering the service. This was the first such training course provided on a naval base in the northwestern United States. In the 1970s the building became the Alameda Counseling and Rehabilitation Effort (CARE), which provided drug and alcohol counseling, rehabilitation, and education for Navy personnel. The center's services, however, were not limited to substance abuse prevention. Over the years the building served as a sort of community center, providing training workshops, individual and group counseling, crisis intervention, referral services, a reference library, and a place for various groups, including 12-step anonymous groups, a place to meet.[1]

Evaluation

Building 116 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[2] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 116 was recorded by the previous studies (attached).

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 116, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (Criterion A / CRHR Criterion 1), or an historically significant individual of that era (Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 116 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Building 116, the Rehabilitation Center, contributes to the NAS Alameda
Historic District under Criterion A because it was built in 1943 as part of the central core of buildings on the base and continues to serve its original function. Under Criterion C, the building is typical of the utilitarian, semi-permanent class of structures common on the base and is unaltered. It is located in an area that still conveys a strong impression of the air station during the period of significance.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 117 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

P1. Other Identifier: Storehouse

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 117 is a large rectangular warehouse covering 106,403 square feet. It has a moderate pitched, front gable roof of composited rolled material. The building is divided into three parts with two dividers extending through the roof. Rising from the concrete foundation are vertical grooved metal siding walls with coordinating corner boards. There is a metal addition of bays along the north side. Wood posts support the shed roof extension. Some of the bays have been boarded over or have corrugated metal sheets to enclose them. The east and west sides include large metal roll-up doors and an adjacent metal personnel door. The south side shows the division of the building into three distinct parts. The western section includes a sliding wood panel door and a metal and glass door under a shed roof. The middle section includes two sets of paired three-over-three double hung windows, a single three-over-three double hung window, and two six-over-six double hung windows. There is an adjacent metal personnel door and wood paneled sliding door, all of which is located under a shed roof extension. The eastern section has no fenestration.

B10. Significance:

This update form was prepared to provide additional information about Building 117, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon and Seaplane Hangars, in an area that was not in within the station's original design axial and formal layout. In 1941 the Navy began construction of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98) along with the shipping warehouse (Building 105, since demolished). Building 112 was built in 1944. Contractors, Cahill Brothers of San Francisco constructed Building 117 in 1943 as a semi-permanent warehouse. In 1953 contractors Anderson-Haglund Company added a lean-to shelter to the north side of the building for the Supply Department. In 1965 the building was converted to pallet rack storage for bulk material to increase the storage capacity and accessibility of material in the warehouse.[4]

Evaluation

Building 117 was part of the original period of construction on the station, and falls within the period of significance of the district: 1938-1945. Although Building 117 is associated with the district's significance under NRHP Criterion A (CRHR Criterion 1) for its contribution to the nation's defense during World War II, the alterations to the area of the station where the building is located prevent it from conveying its association with the World War II context. Furthermore, Building 117 lacks individual integrity and the utilitarian building style prevents Building 117 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[5]

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance or those built within the period of significance (i.e., post-1945), or those built within the period of significance that had lost integrity through alteration. Building 117 was placed in the latter category because the buildings were so altered through multiple changes over time that they do not contribute to the district.[6] Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, storage (like Building 117), and engine test cells. Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the buildings were originally constructed during the period of significance, many exterior and interior changes have been made since that time. A shed roofed addition was added to the northern side of the building in 1953 diminishing the integrity of design, materials, feeling and association. Removal, alteration and replacement of other buildings in the area have impacted the integrity of setting, feeling and association. Building 117, therefore, does not convey its association with NAS Alameda operations during World War II, and is not a contributing element of the historic district.

The history of the station during the Cold War illustrates that Building 117, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 117, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it lacks direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Building 117 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 118 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Storehouse

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 118 is a large rectangular warehouse covering 170,849 square feet. It has a moderate pitched gable roof of rolled composite material with raised skylights in the western portion. The building is divided into four sections and has a shed roof addition to the north. The west side has a large metal roll-up door and an adjacent metal personnel door **(Photograph** 1).

The south side shows the clear division into four sections **(Photograph 2)**. The first section, furthest west, has a double metal louvered door with louver vents. A large sliding door rests under a shed roof extension, a second smaller shed roof extension above the adjacent metal personnel door. The second section includes a sliding wood door, a louvered vent, a boarded window opening, and a shed roof extension over two large boarded window openings, a sliding door with an inset personnel door and adjacent metal personnel door. Beneath the rooftop division between the second and third sections are two boarded up doorways with shed roofs above them. The third section has a small shed roof over a single metal personnel door. It is followed by a raised concrete walkway covered by a flat, shingled, metal roof supported by square posts. The roof addition covers a series of unevenly spaced, boarded-up door openings. Seven single doors are unevenly spaced along the south side and one window section is now faced in faux brick. The east end of the third section also has build-in planters and a seating area outlined by vertical wood fencing. The covered walkways extend through the fourth section of the south side, breaking briefly for a reversed shed roof extension over the main entrance of double doors. The are seven additional single doors and two more double door sets along this section. The main entrance has a partially tiled concrete ramp and is flanked by similar planter boxes.

The covered walkway from the south side wraps around to cover almost half of the east side of Building 118 **(Photograph 3)**. The east side also includes five single doors, two double doors, and one window. Two vents are located above the flat roof line and a large vent is further north. The far north side shows two shed roof additions, the first is metal siding with a six light window and the second is a wood addition with a boarded-up doorway and a vent.

The wood addition runs the length of one section of the building's north side **(Photograph 4)**. The wood addition is on top of a concrete pad, with vertical wood siding and a boarded up doorway. There is a central recessed section that includes a set of double metal doors. West of the recessed doorway is another boarded-up doorway as well as boarded-up vents. The west side of the extension has a small ground level door and boarded-up vent. The second section of the north side has vertical wood siding with a vented double metal door and two single doors next to an external fan unit. The remainder of this section includes a series of unevenly spaced single and double doors and vents. The last two sections on the north side include open bays supported by square metal posts **(Photograph 5)**. Near the western end is a section of plywood that covers two of the bays. Some of the bays in the last section include rolled-up overhead metal doors.

B10. Significance:

This update form was prepared to provide additional information about Building 118, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon and the Seaplane Hangars, in an area that was not in within the station's original design axial and formal layout. In 1941 the Navy began construction of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98) along with the shipping warehouse (Building 105, since demolished). The warehouse Building 117 was built in 1943 and Building 112 was constructed in 1944. Contractors, Cahill Brothers of San Francisco constructed Building 118 as a semi-permanent warehouse in 1944. Stock Upkeep, which was in charge of structural spares, moved their storeroom to the building upon completion. The Requisition and Order Section also established their main office in the building.[4]

In 1965 and 1966 many changes to the building occurred with the addition of the new Navy Exchange and Retail Service center constructed by Wilco Construction Company of San Francisco. Previously located in Building 2, the new Exchange included a retail store, barber shop, beauty shop, tailor shop, laundry and dry cleaning outlets, watch repair, optical, personnel services center, cafeteria, and beverage outlets. General offices were located adjacent to the prior existing service station, garage, and Green Thumb and Country store. The 48,000 square foot Exchange was the largest under one roof in the continental United States.[5] In 1966 the Navy Exchange warehouse was relocated from Building 361 to the new 23,000 square foot warehouse adjacent to the Exchange complex in Building 118 and 72,000 feet of warehouse space was released to Navy Transportation Coordinating Office (NAVTRANSCO). In the late 1960s and early 1970s the retail center and shops within were remodeled and an additional 10,000 feet was added to the main retail store to house additional shops such as a photo studio, a uniform shop, additional clothing departments, self-service department flower shop, sewing center, television repair, and others. In 1975 a loading dock was constructed for $16,500.[6]

The mission of the Navy Exchange was to provide a convenient and reliable source for authorized persons to purchase, at the lowest practicable cost, articles and services required for their well-being and contentment; to provide, through profits, a source of funds to be used for the welfare and recreation of Naval Personnel; and to promote the morale of the command through the operation of a well-managed, attractive and serviceable Exchange. The Exchange was composed of 15 separate functional departments, each of which contributed individually to the

achievement of the overall mission of the Exchange. Each manager was responsible for operation of the department at the Alameda Exchange as well as the operation of the same department at all of the branches including NAS Concord, Naval Regional Medical Center Oakland, NCS Stockton, Naval Station Treasure Island, NAS Fallon, Nevada, and a store at Naval Radio Station Dixon.[7]

Evaluation

Building 118 was part of the original period of construction on the station, and falls within the period of significance of the NAS Alameda Historic District (1938-1945). Although Building 118 has some association with the district's significance under NRHP Criterion A (CRHR Criterion 1), the alterations to the area of the station where the building is located prevents it from conveying its association with the World War II context. Furthermore, Building 118 lacks individual integrity and the utilitarian building style prevents Building 118 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[8]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alterations. Building 118 was placed in the latter category because the area where the building is located was so altered through multiple changes over time that it no longer conveyed the impression of the early air station and did not contribute to the district.[9] The building itself has been heavily modified with the addition of the Exchange in 1965-1966 and no longer appears as it did at its period of construction. Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, storage (like Building 118), and engine test cells. Research undertaken for this project in building plans, base maps, and aerial photographs indicates buildings within the location have been relocated, altered, and new buildings constructed during the Cold War period. The area, which includes Building 118, therefore, does not convey its association with the context of World War II, and is not a contributing element of the historic district.

CONTINUATION SHEET **Trinomial**

Page 8 **of** 8 ***Resource Name or #** (Assigned by recorder) Building 118

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[10] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 118, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Building 118 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

Building 119 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 119 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

The Navy Exchange had Building 119 constructed in 1985 in what used to be a parking area for the surrounding shops. The building served as a McDonald's Restaurant from the time it opened in 1985 until the base closed.[1]

Evaluation

Building 119 was built during the last decade of Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation. [2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building retains some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development

of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for buildings constructed during the 1980s at naval stations and commercial construction in general during at that time (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while this McDonald's restaurant served a beneficial function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

***Recorded by:** C. Brookshear and M. Bunse ***Date:** September 25, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 130 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Medical Lab, Low Pressure Chamber

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 130 is a 10,248 square-foot, two-story rectangular building set upon a concrete foundation. It has a flat, parapet roof that is accessed via an exterior wood stairway and metal extension ladder on the south side. The walls are clad in smooth horizontal wood siding with corner boards. Located on the east façade is the main entrance consisting of a single aluminum-framed glazed door with metal pipe railing. The remaining windows consist of two-over-two metal-framed lights along the second story, the first story windows on the east side are boarded up **(Photograph 1)**. The north side includes an exterior metal staircase to the second-story metal personnel door, which is flanked by additional two-over-two windows **(Photograph 2)**. In the west corner of the north side is a freight door with four vertical panels and four remaining textured glass windows in the upper portion. The other personnel door on the first floor of the north side is boarded up. The west side includes a series of windows on the second story similar to the main façade, with them situated as singles or in pairs. The first story has multiple boarded up windows including six window opens on the southern end that are half the height of the others. There is one slightly offset boarded personnel entrance with a concrete stoop. North of the door opening is metal vent structure. The south side includes the external wooden staircase. The second story has four sets of windows, some of which are missing panes. A double metal personnel door is located in the lower east end of the south side and it has metal machinery adjacent to it that connects to the building with metal piping running to the roof.

B10. Significance:

This update form was prepared to provide additional information about Building 130, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In 1951 the Altitude Training Unit was reactivated and Building 130, the low pressure chamber, underwent reconversion and served all Fleet Air Units in the Twelfth Naval District, ships in the Bay Area, and NASA flight personnel. The Altitude Training Unit conducted a program of oxygen and night vision indoctrination of flight

personnel at the base. Later called the Aviation Physiology Training Unit, it was deactivated in 1961 and moved to NAS Lemoore. The Enlisted Personnel office was located in the building in the 1950s.[1] In 1972 a quarter of the building housed the Thrift Shop (Sea Bag) which moved from Building 135. In 1974 the building also contained a 2,784 square foot laboratory and 5,240 square feet for applied instruction.[2]

In the late 1950s a Disease Vector Control Center was established at Alameda and in the early 1970s the name was changed to DVECC. In the 1990s, DVECC occupied Building 130. The mission of the DVECC was pest management, pesticide evaluation, dispensing pesticide equipment, collecting information on significant pests in the area of command, and conducting local and on-site training to properly administer pesticides. This included preventive measures of disease like malaria, dengue fever, and Lyme disease through the eradication of mosquitoes and other disease carrying insects. DVECC on NAS Alameda served the United States from west of the Mississippi to the Indian Ocean. DVECC later moved to Bangor, Washington.[3]

Evaluation

Building 130 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 130 was recorded by the previous studies (attached).

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure at NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 130, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (Criterion A / CRHR Criterion 1), or an historically significant individual of that era (Criterion B /

CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War Era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 130 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

B10. Significance:

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 133 was constructed by the Public Works Depart of NAS Alameda in 1945 as a semi-permanent Communications Radio Receiving building and contained a homing beacon. It later served as an air traffic control radio facility. Between 1946 and 1949 the building was moved from the north end of the airfield to its present location west of the airfield on newly filled land for the expansion of the Station. There does not appear to be exterior modifications.[1]

Evaluation

Building 133 was part of the original period of construction on the station, and falls within the period of significance of the district: 1938-1945. Although Building 133 is associated with the district's significance under NRHP Criterion A (CRHR Criterion 1) for its contribution to the nation's defense during World War II, the alterations to the airfield prevent it from conveying its association with the World War II context. Furthermore, Building 133 lacks individual integrity and the utilitarian building style prevents Building 133 from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the building was originally constructed during the period of significance, the building has been relocated from its World War II location and not longer retains integrity of location, association and feeling. Plus, the airfield has been reconfigured resulting in a loss of Building 133's association with the historic district. Building 133, therefore, does not convey its association with NAS Alameda operations during World War II, and is not a contributing element of the historic district.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have

[1] Building 133, United States Navy, *Internet Naval Facilities Assets Data Store (iNFADS)*, 2008; IT Corporation, "Zone Evaluation Data Summary Phase 2A Sampling; Zone 1: The Western Landfill Zone; Alameda Point, Alameda, California," January 2001; Building 133, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; US Navy, "Map of NAS Alameda, Calif. Showing conditions on June 30, 1949," RG12, BuDocks Naval Shore Activities-12th Naval District, 1942-54- Architectural Drawings, Maps, Box 1, CEC/Seabee Museum, NBVC, Port Hueneme, California; United States Geological Society, Alameda County, Aerial Photograph, USGS: Washington, 1946.

important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[2]

In the larger context of the naval operations in California and nationwide during the Cold War, the Public Works / Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations during the Cold War. The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the building was moved between 1946 and 1949, affecting its integrity of location and setting. The building has not achieved significance under NRHP Criterion Consideration B (and similar CRHR special consideration) for moved buildings.

***Recorded by:** C. Brookshear and K. Clementi ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 135 is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Community Facilities

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built in 1944, Building 135 is a large building with three branches extending from the main building, creating an "E" shaped plan. This two-story, wood framed structure rests on concrete piers and covers a total of 33,114 square feet. The building has a very low-pitched, asphalt shingle, hipped roof with exposed eaves, exposed wooden beams, and two ventilation cupolas on each section of the building. The main section of the building faces north with an east-west orientation. The building is characterized by wood siding and two rows of two-over-two double hung windows with wooden frames. Throughout the building most of the first floor windows are boarded up, but the second story windows remain intact. Four concrete steps with metal handrails lead to the boarded up double entryway on the north side.

The east wing has extensions at the northeast and southeast ends **(Photograph 1 and 3)**. The northeast extension includes a recessed entry door with a shed roof. A series of boarded window openings run along both stories of the east wing. The south end of the east wing includes a personnel door and boarded window opening. A wooden porch with railing and a shed roof with overhanging fiberglass, and metal doors with single lights characterize the U-shape between the east and central wings.

The center wing has double wooden entry doors with single lights on the southern end **(Photograph 1 and 4)**. A wood ramp and landing provide access to the first floors doors. The second floor staircase has been removed, but the single personnel door and shed roof extension remain. Two wooden ramps lead to single personnel doors on the west side of the center wing.

The west wing has single personnel doors located on both stories on the south side. The ramp and staircase to access the doors have been removed **(Photograph 1 and 4)**. Similar to the east wing, the west wing has slight building extensions on its northwest and southwest sides **(Photograph 5)**. A set of five stairs lead to a recessed wood door with a single light and a boarded transom under a shed roof extension on the north end of the west side of the west wing.

B10. Significance:

This update form was prepared to provide additional information about Building 135, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 135 was constructed in 1944 as a temporary building to house the Bachelor Officers' Quarters (BOQ). By 1956 the Navy had begun to use the first floor of the west wing as an all denominational Sunday School as well as a Station Nursery. By 1963 in addition to the BOQ, Sunday School and nursery, the building was also being used as offices for Moral, Welfare and Recreation (MWR). In the 1960s as more families moved onto the base the Navy began to enlarge its community services in Building 135. They began a pre-school with qualified teachers in addition

to refurbishing the childcare center. In 1968 a thrift shop began to operate there as well. By 1972 there was a functional Youth Center with its own arts and crafts room and space was provided to other childrens organizations such as the Boy and Girl Scouts of America. Additionally the Navy also set aside 80 square feet for a Fire Protection Pump Station. In 1974 the Red Cross and Navy Relief moved their offices in Building 135. The BOQ was still located in 135 but had diminished from occupying the original 64,000 square feet to 8,805 square feet.[1]

Uses of the Building in 2001 included a chaplain's office, the Navy/Marine Corps Relief Society, the Red Cross, a childcare center, education offices and classrooms, and equipment rental offices.[2]

Evaluation

Building 135 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[3] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 135 was recorded by the previous studies (attached).

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore, no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 135, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP

IDENTICICATION AND LOCATION

1. & 2. Historic/Current name: Building 135, Community facilities
3. Street: Ave. A, **NAS Alameda Map** L-24 City: Alameda Zip: 94501
Country: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a two-story, wood-frame building with weatherboard siding and a very low-pitched hip-roof with monitors. The E-shaped building has wooden doors with glazed sections and fire doors on the upper story at the ends of the wings that are reached by flights of wooden steps. Typical windows have 4-light, wood, hopper sash in wood frames. The total length of the building is 198 feet; the front is 28 feet wide.

HISTORICAL INFORMATION
14. Construction date: 1944 Original location: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION
18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Building 135 was constructed in 1944 near the end of World War II and therefore qualifies for inclusion in the NAS Alameda Historic District under Criterion A. Under Criterion C, the building also contributes because it is representative of the type
of wood-frame construction used for the semi-permanent class of building on the base and remains unaltered and in good condition. The building also contributes to the streetscape on Avenue A, an important axis near the Main Gate, and reinforces the impression of the naval air station as it was during the period of significance.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

Page 1 **of** 6 ***Resource Name or #** (Assigned by recorder)**:** Building 137

***Recorded by:** C. Brookshear and K. Clementi ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Recreation Storage Facility

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 137 has an irregular shape with multiple extensions with a 'T' shaped second story covering 27,346 square feet. Overall the building rests on a concrete base; it has a flat roof with open eaves and exposed beams capped by wood fascia. The walls are clad in horizontal wood siding and many of the windows are now boarded up (**Photograph 1**).

The east side of the building includes concrete steps and a ramp that lead to metal personnel doors. A wood shingle shed roof extends over the doors. The north half of the windows are boarded up on this side, however, it does have a sliding wood bay door. The remaining fenestration includes three pairs of two-over-two wood frame windows. Between the first and second story is a half-story with clerestory windows topped by a flat roof that has a moderate overhang with exposed eaves and rafters (**Photograph 2**).

The north side of Building 137 creates a U-shape with building extensions on the east and west and a second story exists above the entrance (**Photograph 3**). The buildings main entrance is a recessed double metal entry door flanked by decorative wood paneling. The entryway has a shingled shed roof extension supported by square wood supports. Windows along the first floor are boarded up and a single double hung window on the second story remains; its pair has been boarded up.

The west side creates a large U-shape around an outdoor patio area (**Photograph 4**). A two-story tower extension is also located within the U-shape. The south side extension is two stories with a boarded up doorway facing west. The north side extension is a single story with rows of boarded up windows and a single personnel door within the U-shape and boarded windows on the west end. A single metal personnel door faces west within the U-shape of the building.

The south side of the building is two stories high with rows of two-over-two double hung windows on both stories, most of which are boarded up (**Photograph 5**). A metal double personnel door is located at the east end and has a metal vent placed above it. A single metal personnel door is located west of the double entry. Centrally located is a single sliding door next to a large metal vent extending out from the building.

B10. Significance:

This update form was prepared to provide additional information about Building 137, to asses if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Louis C. Dunn Construction Company of San Francisco constructed Building 137 in 1945 as a semi-permanent building for a Bachelors Officers Quarters Mess and galley. Between 1953 and 1963 the function of the building changed to general storage and an electronics communication maintenance shop. A Non-Commission Officers Club was located in the building from the late 1960s until it moved to Building 32 in 1974. The auditorium was used for Navy Wives' Club meetings, parties, and other social events.[2]

In the late 1960s the Family Services Center relocated to the building and renamed it the Community Center. The Family Services Center mission was to assist military personnel to find civilian or military housing. In the early 1970s a youth and community center were opened and the building was also used by special interest groups for classes and instruction. A package store was also located in the building and in the late 1970s the Navy Exchange Vending Department moved from Treasure Island to NAS Alameda in Building 137 to reduce operation costs. The building has a sporadic history as a teen center in the 1960s, 1970s, and 1990s.[3]

Evaluation

Building 137 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 137 was recorded by the previous studies (attached).

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 137, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (Criterion A / CRHR Criterion 1), or an historically significant individual of that era (Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 137 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

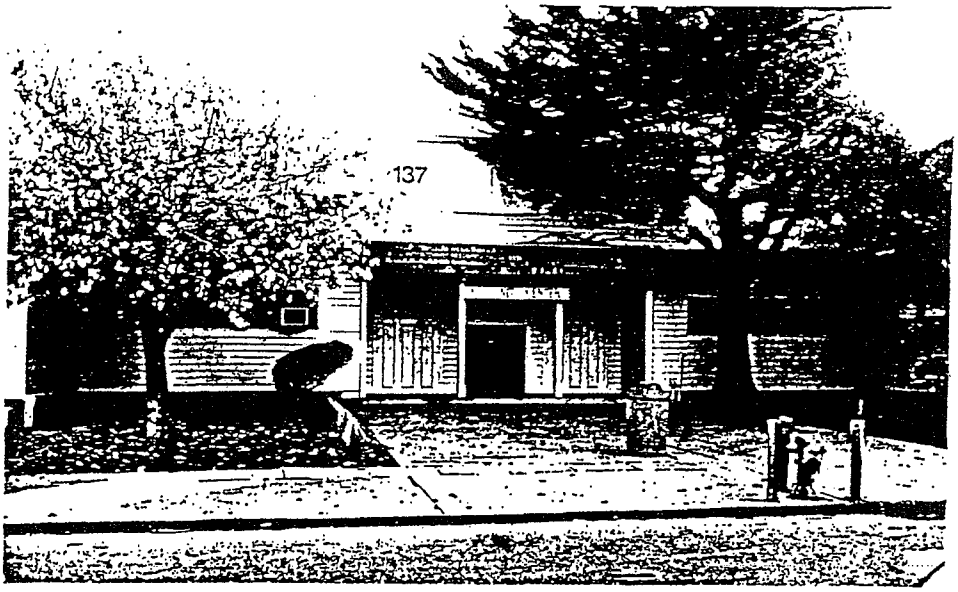
HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 137, Recreation storage facility
3. Street: Ave. A NAS Alameda Map J25 City: Alameda Zip: 94501
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: an irregular, rectangular, wood-frame building composed of various elements, some of them storehouses, of different heights. The building is clad in weatherboard siding and the different elements have flat roofs. The front part of the building has offices and other spaces with a variety of windows, most of which are wood-framed and have wooden hopper sash with multiple lights. Entrance doors are wooden.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none



NAS ALAMEDA Building 137

HISTORICAL INFORMATION

14. Construction date: 1945 Original location: yes
15. Alterations: minor changes to openings that do not effect integrity
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: Building 137 contributes to the NAS Alameda Historic District because it was constructed in 1945 in the period of significance and retains a high degree of physical integrity. Architecturally, it is representative of the type of semi-permanent wooden buildings that were built on the base in the first half of the 1940s. It also contributes to the streetscape on Avenue A which is an important cross axis near the Main Gate.

20. Sources: NAS Alameda records

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

Page 1 **of** 11 ***Resource Name or #** (Assigned by recorder) Building 152

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 12, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Building 152 is not eligible for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Commissary

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete foundation, Building 152 is two stories with a rectangular plan that measures 368 feet by 222 feet totaling 106,949 square feet. The east side of the building is clad in horizontal wooden siding on the upper level with a deep, flat roof over a full front porch on concrete encased metal posts (**Photograph 1**). The lower half of the building wall is concrete with the upper half of masonite or asbestos shingles. Two sets of concrete ramps are located to the north with metal and wooden rails. Three entries are now boarded over, as are all openings on the bump-out located halfway along the first story portion (**Photograph 2**). A pair of metal utility doors are located at the northeast end. The east side of the building is predominately a loading dock area on a raised concrete platform with ramps at the east and west ends. The eastern end is clad in masonite or asbestos siding with a wide overhang roof. A personnel door with glass window pane and ten one-over-one hopper ribbon windows comprises the east end (**Photograph 4**). The middle section of the east side is the loading dock area with twelve metal supports. The recessed area of the loading dock has two pairs of metal doors, two refrigerator units, a plywood delivery office, and one overhead door (**Photographs 5 through 8**). The west end of the south side has paired two-over-two windows and a pair of metal doors with a cantilevered wooden roof on the east end over the raised concrete delivery dock (**Photograph 9**).

The west side of the building has a board formed concrete base with remnants of concrete piers and masonite or asbestos shingles. The south end is one-story with evenly spaced paired two-over-two windows with a shed awning wood shelter with knee brackets over a personnel door that lacks stairs (**Photograph 10**). The western two-thirds of the west side is two-stories with evenly spaced paired windows on the second story that are boarded over. Four three-quarters height doors with transoms are located between window pairs. One three-quarter height utility door is located on the first floor as well as a sliding plywood door with concrete ramp near the north corner. A concrete platform as the north corner has a set of metal double doors with louvered vents to a boiler plant (**Photograph 11**). The two doors flank a pair of two-over-two windows.

The north side of the building is two-stories with a boxed overhang along the majority of the length of the building on the second story that is clad in horizontal wood siding (**Photograph 12**). The first story is clad with masonite or asbestos shingles. Along the length of the north side there are irregularly spaced two-over-two windows with metal security grills that are predominately paired and evenly spaced. Three recessed two-bay delivery areas with asphalt ramps are located approximately in the center section of the north side. The two bays on the east end have three pairs of windows and a pair of metal doors. The western bay has a six-over-five panel overhead door and two personnel doors (**Photograph 13**). There are two docks with concrete platforms with pairs of personnel doors and suspended protective roofs. Two single personnel doors are located toward the west end of the north side.

The 'U' shaped second story along the west and built behind the north and south sides of horizontal wood siding, is constructed of corrugated fiberglass with personnel doors and a variety of multi-pane window styles. Located within the 'U' are an additional three buildings, two are rectangular and the center has a square plan with square addition to the south side, with window groups of three and four.

B10. Significance:

This update form was prepared to provide additional information about Building 152, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 152 was built in 1945 by the Louis C. Dunn Construction Company of San Francisco as a semi-permanent building. The commissary originally occupied 35 percent of the first floor, the Navy Exchange store occupied 25 percent, and 40 percent of the first floor and the entire second floor was entirely public works storage. After closure for remodeling the Commissary Store reopened in July 1951 and the expanded retail store occupied 25,000 square feet of the first floor. The Commissary was renovated again in 1957. In 1963-64 automatic entrance and exit doors were installed and the ramp on the front of the store added. In 1971 the front and north side of the building was remodeled and a covered area for shopping carts was added. In 1981 part of the building was rehabilitated by the Seabees, Self-

*Recorded by: C. Brookshear and C. Miller *Date: November 12, 2009 ☐ Continuation ☒ Update

Help, PWC and other contracts for use as a barracks by personnel of tenant organization, Ship Intermediate Maintenance Activity (SIMA).[1]

NAS Alameda is typical of military bases because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities like the Commissary through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 152 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Evaluation

Building 152 lacks individual integrity due to alterations over time, which prevents Building 152 from conveying any significance it may have had under NRHP Criteria A and C (CRHR Criteria 1 and 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.

CONTINUATION SHEET **Trinomial**

Page 11 **of** 11 ***Resource Name or #** (Assigned by recorder) Building 152

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 12, 2009 ☐ **Continuation** ☒ **Update**

> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[2]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Building 152 was placed in the latter category because the buildings were so altered through multiple changes over time that they do not contribute to the district.[3] Alterations include the addition of automatic entrance and exit doors, the ramp on the front of the store in the 1960s, the front and north side of the building was remodeled and a covered area for shopping carts was added in the 1970s, and the rehabilitation of Building 152 in the 1980s. Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the buildings were originally constructed during the period of significance, many exterior and interior changes have been made since that time. Building 152, therefore, does not convey its association with NAS Alameda operations during World War II, and is not a contributing element of the historic district.

The history of the station during the Cold War illustrates that Building 152, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period.

In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building retains some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

Building 152 does not meet the criteria for listing in the NRHP individually, nor is it located within or a contributor to the NAS Alameda Historic District.

***Recorded by:** M. Bunse and R. Flores ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is not eligible for listing in the NRHP, either individually nor is it located within the NAS Alameda Historic District. It has a NRHP status code of 6Z.

P1. Other Identifier: Engine Accessory and Overhaul Facility

P2 e. Other Locational Data: 400 West Atlantic Avenue on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 162 is a roughly rectangular plan wood frame structure with a long one-story addition on the north side, one-story addition at the northeast corner, and a bump out at the southwest corner **(Photograph 1)**.

The bump out on the west side has two rows of ribbon windows with shed roof awnings and external pipe venting. The north side of the bump out has a metal double personnel door **(Photograph 2)**. The west side of the main building has two rows of ribbon windows and shed roof awning that wrap around the corner to the north. A wooden staircase extends to the upper level corner to a personnel door with three light transom. A wooden ladder leads to the roof of the west bump out. A large roof vent is located at the northwest corner **(Photograph 2)**. The north side of the main building has a boarded up entrance with a pair of double metal doors, a single metal door, and other openings boarded up with six fixed transom windows. A personnel door is located on the east as well A flat roof canopy is located above the entrance doors **(Photograph 3)**.

The one-story industrial flat roof addition on the north side has two sliding metal doors with one inset personnel door, two narrow metal utility doors, and a wooden double door, all of which are irregularly placed on the north wall. A series of 49 ribbon windows with shed roof awning is located in the upper level. A three-window wide clerestory is located on the roof with single pane fixed windows on the east and west sides **(Photograph 4)**. A wooden double personnel door is located on the east end **(Photograph 5)**.

The east end of the north side has two wooden double personnel doors **(Photograph 5)**. Two staircases lead to doors on the upper level with a ribbon window and shed roof awning on the same level **(Photographs 5 and 6)**.

The northeast corner of the building has a one-story concrete addition with a one-half story on the northwest end. On the north side is a single metal personnel door located on the one-half story end with a double metal personnel door with four two-part sliding windows covered with metal mesh on the east end. Fenestration on the east side includes three groups of sliding windows with metal mesh, the southern most group flanks a metal personnel door. The south side has a metal double personnel door with exterior ladder for roof access in the west corner. Large roof venting is located on the roof **(Photograph 7)**. The remainder of the east side has a double metal personnel door and with a series of irregularly shaped and placed openings that have been boarded over. A fenced in metal utility box on a concrete slab is located at the southeast corner **(Photograph 7)**.

The south side has four irregular sized sliding metal equipment doors that are irregular placed, three of which have an inset personnel door. A wooden sliding equipment door at the southeast corner has been replaced with a metal overhead door **(Photograph 8)**. A metal overhead door and four metal personnel doors, one being a double door, are located on the ground level. An exterior metal staircase leads to a metal personnel door on the upper level **(Photograph 9)**. Fenestration at the upper level includes twelve single fixed pane windows, six of which are covered. Three shed roof metal structures for enclosing external equipment are located on the south side, one of which has been removed **(Photograph 9 and 10)**. Four groups of three louvered vents are located near the roof line.

B10. Significance:

This update form was prepared to provide additional information about Building 162, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4;

in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars.[3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the original design axial and formal layout. In 1941 the Navy had constructed the initial portion of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building 162 was constructed in 1945 as an engine overhaul shop by Stolte Incorporated of Oakland. Between 1945 and 1950 an addition with a clerestory was built on the north side of the building. Between 1953 and 1955 accessory overhaul was moved to Building 162 from Building 113 when it became necessary to install additional fuel control testing equipment. Operations within the building were classed as high hazard industrial operations and included a paint shop, cylinder and piston shop, blower, power case and nose-section sub-assembly, plating shop, clearing shop, welding and metal repair, carburetor shop, and pump and valve shop.[4]

JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

***Recorded by:** M. Bunse and R. Flores ***Date:** October 15, 2009 ☐ **Continuation** ☒ **Update**

In July 1973, San Francisco Fleet Maintenance Assistance Group (FMAG) was established on NAS Alameda to improve the material condition of the fleet. Building 162 housed the administrative, repair, planning and supply offices and the following branches and shops: Mechanical branch with internal combustion engine, AC&R, valve and pump, sandblast/ acid dip, ship force tool issue shops; Electrical branch with motor and generator, outside electric and interior communications shops; and Electronics branch with electronics and electronic warfare shops.[5] Between 1973 and 1987, San Francisco Fleet Maintenance Assistance Group (FMAG) was renamed the Shore Intermediated Maintenance Activity (SIMA). The mission of SIMA was to provide ship repair services beyond the capability of ship's forces, but below the level of complexity requiring a shipyard. Secondary missions include providing shore duty and training to sailors who spend most of their time at sea as well as training reserve personnel during weekends and while on active duty. SIMA included 41 shops grouped into six divisions on NAS Alameda which included: Hull, Machinery, Electrical Repair, Electronics and Combat Systems, Diving and Salvage, and Deck and Aviation Division.[6]

Evaluation

Building 162 was constructed in 1945 with an addition between 1945 and 1950. Although construction of the Building 162 was part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), the building lacks architectural significance and integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity and utilitarian building style prevents Building 162 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original district boundaries were drawn to include areas which were a part of a formal station plan and shared architectural similarities. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non- contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[7]

Building 162 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and included considerable post-1945 construction. These factors prevented the area from conveying the appearance of the station during the period of significance (1938-1945).[8] Early plans for the station do not include some support /

[6] US Navy, *1992 NAS Alameda Base Directory*, Box 2 of 22, 5757-1b, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco), 38; US Navy, *Naval Air Station, Alameda, Command History 1987*, 1987 Command History folder, Box 2 of 2, 5757-1b, NAS Command History, 30 Volumes, 1968-1997, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).
[7] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," (1992), 1-2, 11-12.
[8] Woodbridge, "Historic Architectural Resources Inventory," inventory form for Building 162.

storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the locomotive repair shop, paint / oil storage, engine test cells, and engine overhaul shop (Building 162). Research undertaken for this project in building plans, station maps, and aerial photographs indicates that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[9] Expansion in this area began during World War II, but was utilitarian in style and lacked the architectural characteristics of the formal station plan seen in the NAS Alameda Historic District. Building 162 was also constructed in the final year of the period of significance and it not as closely associated with the period as the other buildings within the district constructed at the beginning of the period of significance. In addition, Building 162 itself lacks integrity of design, materials and workmanship due to the 1945-50 addition.

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[10] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 162, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 162 played a role in the operations of the station, but while it served this function on NAS Alameda during the Cold War era and serviced technologically sophisticated aircraft and engines – it did not play a significant role in their research, design, testing and evaluation, functions that might have imbued it with exceptional significance.

Building 162 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

B10. Significance:

This update form was prepared to provide additional information about Building 163, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The western end of Alameda was predominately tidal lands prior to the establishment of NAS Alameda. A series of industrial complexes were built in the area in the late nineteenth and early twentieth century. Building 163 is located on the previous site of the Pacific Coast Borax Company that was built in 1893 and in operation until 1931.[1] H.C. Hacke of Alameda purchased site of the former Borax works and planned to establish his own chemical works there in 1937. Hacke, born in 1866, began his career as a clerk in the chemical business and eventually owned his own chemical wholesale company. He planned to spend $100,000 to construct a plant near the former Borax works. Historical mapping, however, indicates Hacke only completed one building, Building 163, by 1939. According to newspaper accounts Hacke had anticipated a growth in industry associated with NAS Alameda development.[2] The Navy acquired the building with purchased land in 1944 and removed the borax plant buildings and other structures in the area. Under Navy ownership, the building was used as a Public Works Equipment and Maintenance shop as well

as an industrial chemical storehouse until around 1948.[3] Later it was used for aircraft maintenance. In the late 1960s, the building housed Plant Maintenance for Building 360.[4] The Navy added lean-to additions on the north and south ends between 1966 and 1976.[5] The name "The H.C. Hacke Chemical Works" is painted on the building, which pre-dates the Navy's use.

Evaluation

Building 163 was constructed in 1939 prior to the expansion of NAS Alameda into the area and is not significant individually for associations prior to Naval involvement. Building 163 is not associated with the development of industry in the City of Alameda (NRHP Criterion A / CRHR Criterion 1), nor is the building associated with any significant people (NRHP Criterion B / CRHR Criterion 2). The Hacke chemical works was in operation for only a short period before the Naval station expanded into the area. Previous chemical works in the area, notably the Borax Company, had already established the industry in Alameda. H.C. Hacke, himself, was an entrepreneurial businessman with moderate success. The building is an example of modest early twentieth century industrial architecture and is not significant under NRHP Criterion C/ CRHR Criterion 3. In addition, the building has been altered since its construction in 1939, and does not retain integrity of design.

The additional information provided by this study does not alter the evaluation made by Woodbridge for the World War II period. Although Building 163 was incorporated into the development of the station, and falls within the period of significance for the NAS Alameda Historic District, the building is not a contributor. While utilized for station activities during World War II it lacks integrity of setting and feeling and does not convey its potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity, lack of association with the station plan and utilitarian building style prevents Building 163 from conveying any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[6]

Page 6 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 163

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 14, 2009 ☐ **Continuation** ☒ **Update**

Building 163 was considered outside the boundaries of the district in an area containing buildings that lacked integrity and considerable post 1945 construction. These factors prevented the area from conveying the appearance of the station during the period of significance (1938-1945).[7] Research undertaken for this project in building plans, station maps, and aerial photographs indicates that this area was not a part of the original formal station plan. The building was constructed prior to the station by a private party, further disassociating it from the station plan. The Navy acquired this area during expansion in 1944. In addition, Building 163 itself lacks integrity of design, materials and workmanship to either the pre-station era or period of significance (1938-1945) due to the 1966-76 addition.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War Era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 163, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 163 performed standard storage functions and housed maintenance activities found throughout the Navy.

Building 163 does not meet the criteria for listing in the NRHP individually, nor is it located within the NAS Alameda Historic District, and has a NRHP status code of 6Z.

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Although this unreinforced brick building of 1939 is one of the earliest buildings on the base, it does not contribute to the NAS Alameda Historic District because it has lost integrity through alterations. Moreover, it is located in an area that has also changed and no longer conveys a strong impression of the early naval air station.

20. Sources: NAS Alameda records

This water treatment facility, Building 164, is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. (See Continuation Sheet.)

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Navy building records state that Building 164 was constructed in 1960 as a water treatment facility and later used as a portable Public Works administration building. However, this building has a modern appearance, and it does not appear at this location in historic aerial photographs or base plans. It is on the 1993 base plan at this location and is listed as a transportation trailer. A building appears in the vicinity in a 1985 aerial; however, that building is oriented east to west. It is possible this building was moved from a different location; however, it is likely, given its appearance and its current use, the building was built more recently and given a building number from an older, possibly demolished building.[2]

Evaluation

Building 164 is listed as having been constructed during Cold War era, and would have been part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of

operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the public works function of this building would not have played a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building function was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is utilitarian in design, materials, and construction methodology and is relatively common for naval stations or industrial facilities (NRHP Criterion C / CRHR Criterion 3). This building does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 164 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building contractors Johnson Drake and Piper built Building 175 in 1943. The building, 116 square feet, originally served as an electrical transformer house and continued to be used in this function. There have been no additions to the building.[1] For many decades Building 175 was situated adjacent to an area used for subterranean aviation gas storage tanks. The landscape area in which it sits was redeveloped in the 1970s and 1980s. Installation of the decorative landscape at the East Gate began in 1977. A movement began in 1983 to further develop the East Gate because it was the primary entrance used by military personnel and it lacked appropriate signage as well as the desired aesthetics for a major entry to the base. In 1987, as part of the redevelopment of the East Gate, Construction Battalion 416 ("Seabees") constructed the concrete foundation and pedestal for the new plane monument (Building 71) along with a new plaque mount northeast of the structure.[2]

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique to NAS Alameda or the military and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[3]

CONTINUATION SHEET **Trinomial**

Page 4 **of** 5 ***Resource Name or #** (Assigned by recorder) Building 175

***Recorded by:** C. Brookshear and H. Miller ***Date:** October 14, 2009 ☒ **Continuation** ☐ **Update**

Individual buildings constructed during World War II, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. Building 175 did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Evaluation

Building 175 was built during World War II operations on NAS Alameda, as a part of the infrastructure serving the station during the war and the subsequent Cold War era. In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Building 175 is needed to support modern urban activities, and its ubiquitous nature renders it secondary in the context of station operations. The building retains some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the building is situated outside the boundaries of the NAS Alameda Historic District (determined NRHP eligible). The building is not a contributor to the historic district because it lacks sufficient historic significance and it is not within an area that has sufficient historic integrity to convey the significance of the historic district within its period of significance (1938-1945).

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Building 191 does not appear to meet the criteria for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR).

Building 191 is located within the boundaries of the NAS Alameda Historic District identified by Sally B. Woodbridge as a part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992, however, this building was not evaluated as a potential contributor at that time. This form: 1) re-evaluates the eligibility of this building within the World War II-era historic context for the station, assessing whether the building is historically significant and should be included as a contributor to the NAS Alameda Historic District; and 2) to evaluate the building's significance under Cold War themes.

***P3a. Description (cont.):**

The west wall is open with metal and wood construction resting on concrete piers and pipe balcony with a west-east oriented central corridor on the first and second levels **(Photograph 3)**. The north side also has 25 storage bays with a mixture of plywood and vertical wood double doors. The east end of the north side mirrors the south.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The Navy constructed Building 191 in 1944 as a semi-permanent building. The majority of the building consists of storage racks for material used in the workshops of adjacent Building 114. The east end of the building was the locksmith shop area. The building was expanded between 1963 and 2001 from 4,519 square feet to 5,000 square feet.[1]

Evaluation

In terms of Building 191's place within the existing NAS Alameda Historic District, this evaluation concludes that it is not a contributing resource. Although construction of Building 191 occurred during of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), it is an undistinguished example of a common building type and does not convey potential association with the district's historic significance. Furthermore, its common utilitarian design and its later modifications through expansion of the building between 1963 and 2001 diminish its historic integrity and its ability to convey significance associated with the historic district's period of significance. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextual [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the

[1] Building 191, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; *P-164*, 1963 edition, Archives Box 38, CEC/ Seabee Museum, NBVC, Port Hueneme; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 13: The Central Light Industrial Zone; Parcel 76: Building 191; Alameda Point, Alameda California," January 2001; United States Navy, *Internet Naval Facilities Assets Data Store (iNFADS)*, 2008.

> district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[2]

The buildings considered non-contributors were those within the district that were either built outside the period of significance (i.e., post 1945) or those built within the period of significance that had lost integrity through alteration. Building 191 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II. Research undertaken for this project in building plans and other sources indicates, Building 191 was not a part of the early station plans and was built in the final year of the district's significance. The obscure placement of the building prevents it from contributing to the overall district appearance. The building is also not constructed in the prevalent district style. For these reasons it is considered a non-contributor to the district.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Navy operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Navy facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 191, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 191 supported a shop which in turn supported fleet operations, thus it is not directly associated with significant activities of the Cold War.

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). This building is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Commissary Office

P2 e. Other Locational Data: On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 193 is a 1,000 square foot building connected to the north side of Building 63. Built on a concrete foundation, it is a wood-frame building with composite roll siding clad in stucco. The concrete shed roof trimmed with wood has a one-foot overhang on the west side. Fenestration includes boarded-up windows of various sizes around the building. Single personnel doors on the west and east sides have boarded-up transom windows and a wooden shed roof above the doors. Wooden stairs and handrails are missing from the east side. At square cove is recessed into the northeast corner of the building.

B10. Significance:

This update form was prepared to provide additional information about Building 193, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of Naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

American Electric Construction Company of San Francisco built Building 193 as a semi-permanent commissary office in 1944 behind the back of the Mess Hall Galley (Building 3). Uses have included bakery storage, a typewriter repair room, fire department storage, and administrative offices.[1]

Evaluation

Building 193 was built during the initial construction of the station, and is a contributing element of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[2] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The architectural significance of Building 193 was recorded by the previous studies (attached).

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 193, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not individually possess Cold War-era significance, Building 193 remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

B10. Significance (cont.):

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building contractors Johnson Drake and Piper built Building 196 in 1943 as storage for flammable substances. Building 196 continued to be used in this function. There have been no known additions to the building.[1]

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

Evaluation

Building 196 is located within the boundaries of the NAS Alameda Historic District identified by Sally B. Woodbridge as a part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992, however, this building was not evaluated as a potential contributor at that time. Although construction of Building 196 occurred during of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), it does not contribute to the significance of the NAS Alameda Historic District. The buildings considered non-contributors to the historic district were those within the district boundaries that were either built outside the period of significance (i.e., post 1945), those built within the period of significance that had lost integrity through alteration. The Woodbridge study also identified ineligible a series of "miscellaneous sheds remaining from the period of significance… judged not to contribute to the

historic district because of their temporary nature."[3] Although not specifically listed, Building 196 is similar in form and function to the nondescript buildings listed in the report. The Navy's building records indicate that Building 196 was constructed as a temporary structure, a common practice during World War II. Furthermore, Building 196 did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during World War II. The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextual [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> …. Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[4]

In the larger context of the naval operations in California and nationwide during this period, the utilitarian function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). This resource is unremarkable in its use in routine fleet support, and was not historically important, within the context of NAS Alameda's station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 196 is utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It was also not constructed in the prevalent architectural style of the historic district.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 196, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

P3a. Description (cont.):

The façade is composed of two setbacks that include utility room access and additional entrances as well as a utility room extension west of the entrance. The main entrance is recessed beneath an overhang supported by square posts.

The building is characterized by large, metal-framed, hopper windows and smaller fixed windows, which are also found in the dormers. Door styles include a combination of solid metal doors, wood and glazed personnel entrances and double glazed doors at the main entrance. The courtyard within the U-shape includes a covered walkway supported by square posts, which runs between to the two wings and the patio roof extensions located on each wing. There is a small shed roof extension facing north within the courtyard that is composed of a series of large fixed windows. The east and west sides of the building include large shed roof extensions. The east side has two of these patio roofs, one of which is corrugated metal and the other is metal framed with composition shingles **(Photograph 2)**. The west side includes one large metal framed patio roof with composition shingles.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This building is not eligible for listing in the NRHP or CRHR because it does not individually possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 258 is a later addition to NAS Alameda, with its construction date of 1985. It was built east of Main Street, at the eastern edge of the base, an area that primarily functioned as housing.

***Recorded by:** J. Jones and K. Clementi ***Date:** December 22, 2009 ☒ **Continuation** ☐ **Update**

The North Housing area, located just north of Building 258, was constructed in 1969.[1] Between 1975 and 1981, the George P. Miller Elementary School was built east of Building 285. By this time, the Navy required a child care facility to serve this part of the base and erected Building 258. By 1987 the Child Development Center was running at full capacity. That same year saw improvements made to the kitchen facilities and installation of new playground equipment. The center primarily served infants, toddlers and provided preschool, along with day care provided for older youths. The building was improved further between 1988 and 1993 with the addition of the corrugated metal patio roof on the east side and the utility room extension on the façade. During the 1990s, this facility also served as the headquarters for the Family Home Care Program in which child care certified military dependents could provide child care in their government housing units. At this time, the Navy expanded housing in this area with the construction of the residential area south and west of the Child Development Center. The Navy built this permanent structure to serve as a nursery and child care facility.

Aside from the few additions made to Building 258 in its early years, the Child Development Center retains much of its original plan and use [2]

Evaluation

Building 258 is the only property east of Main Street recorded for this project. Building 258 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it retains some integrity to when it was originally built, the building is unremarkable in its use in routine fleet support, and is not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general.

Moreover, the building was apart from the main operations on the base. Most of the buildings in the surrounding area were built since the late 1960s and function as residential units. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for buildings constructed

[1] North Housing area was recorded and evaluated in January 2009 by Navy historian David Sproul. The Navy concluded that the housing area was ineligible for listing in the NRHP. David Sproul, Naval Facilities Engineering Command Southwest, "DPR 523 Site Form for North Housing Parcel," January 10, 2009.

during the 1980s at naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 258 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Building 265 does not appear to meet the criteria for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR).

The Navy constructed Building 265 in 1945 within the period of significance of the NAS Alameda Historic District (1938-1945) identified by Sally B. Woodbridge in 1992, however it is not within the district boundaries and was found to be a "non-contributing temporary or miscellaneous, nondescript structure," thus it was not evaluated as a potential contributor. This form was prepared to: 1) re-evaluate the eligibility of this building within the World War II-era historic context for the station, assessing whether the building is historically significant and should be included in the NAS Alameda Historic District; 2) to provide additional information about Building 265 to assess if it retains integrity; and 3) to evaluate the building's significance under Cold War themes. (See Continuation Sheet.)

B10. Significance (cont.):

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of

[1] H.C. Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon, in an area that was not in within the station's original design axial and formal layout. In 1941 the Navy had constructed the initial portion of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Building contractors Stolte, Incorporated of Oakland constructed Building 265 in 1945 for housing administration storage. It was subsequently used to store flammable materials. There have been no additions to the building.[4]

Evaluation

Building 265 was built during the final year of World War II operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. Although Building 265 has some association with the district's significance under NRHP Criterion A (CRHR Criterion 1), the alterations to the area of the station where the building is located prevent it from conveying its association with the World War II context. Furthermore, Building 265 is an undistinguishable example of a common building type and does not convey any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[5]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Additionally, Woodbridge did not evaluate some buildings, like Building 265, that were considered temporary or miscellaneous, or nondescript. Building 265 was placed in the latter category. It is relevant to also place this building among the resources that were considered to be an area of the station that was so altered through multiple changes over time that it no longer conveyed the impression of the early air station and did not contribute to the district. Early

[4] Building 265, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; *P-164*, 1963 edition, Archives Box 38, CEC/ Seabee Museum, NBVC, Port Hueneme; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 17: The Engine Testing and Hazardous Materials Storage Zone, Parcel 137, Building 265, Alameda Point, Alameda California," January 2001; Building 265, United States Navy, *Internet Naval Facilities Assets Data Store (iNFADS)*, 2008.

[5] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," 1992, 1-2, 11-12.

plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, storage (like Building 265), and engine test cells. Research undertaken for this project in building plans, base maps, and aerial photographs indicates buildings that this area was not a part of the original formal station plan and that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[6] It is also within an area of the station that includes buildings that have been relocated, altered, and newly constructed during the Cold War period. The area, which includes Building 265, therefore, does not convey its association with the context of World War II naval facilities in the Bay Area, and is not a contributing element of the historic district.

In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). This storage type was unremarkable in its use in routine material supply, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 265 is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It does not have a direct or important association with a historically significant individual, and it is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). This building is not within the identified NAS Alameda Historic District and, as noted, does not have sufficient historical significance or design elements to justify expanding the district to include Building 265.

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 265, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 265 provided storage of gas cylinders necessary for aircraft and shop operations. It is not directly associated with significant activities of the Cold War.

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Building 271 does not appear to meet the criteria for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR).

The Navy constructed Building 271 in 1945 within the period of significance of the NAS Alameda Historic District (1938-1945) identified by Sally B. Woodbridge in 1992, however this building was not previously evaluated in that study or any other historic resource survey. This form: 1) evaluates the eligibility of this building within the World War II-era historic context for the station, assessing whether the building is historically significant and should be included in the NAS Alameda Historic District; 2) to provide additional information about Building 271 to assess if it retains integrity; and 3) to evaluate the building's significance under Cold War themes.

B10. Significance (cont.):

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and original construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of

Sullivan, "Base Planning," *U.S. Navy Civil Engineer Corp Bulletin 1*, no.5 (April 1947):118-122; US Navy, Command History 1 of 25, "Naval Air Station Alameda, California History 1 Nov 40 – 31 Aug 45," Box 1 of 2, NAS Command History, 27 volumes, 1940 to 1992, US Naval Shore Establishments, RG 181, NARA (San Francisco); JRP Historical Consulting, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, California Historic Military Buildings and Structures Inventory (prepared for the U.S. Army Corps of Engineers, Sacramento District, Sacramento, CA, 2000), 6-1 – 6-4; JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

[2] JRP Historical Consulting Services, "The History and Historic Resources of the Military in California, 1769-1989," Volume 2, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 6-1, 6-2, 6-4, and 6-7; Charles F. O'Connell, Jr., "Historic American Engineering Record, Quonset Point Naval Air Station HAER RI-15," Historic American Engineering Record, Library of Congress, Washington D.C., http://memory.loc.gov/habshaer accessed January 26, 2010, 39-45; United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, 3-9, 61-70

these throughout the period between the two wars. [3] BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes, but also included unplanned areas necessary for future expansion.

The Navy added facilities east of the Seaplane Lagoon and Seaplane Hangars, in an area that was not in within the station's original design axial and formal layout. In 1941 the Navy began construction of Building 13. The following year four new support buildings were constructed in the area east of the Seaplane Lagoon (Buildings 66, 67, 77, and 98), along with the shipping warehouse (Building 105, since demolished). Other buildings were added later, such as Building 265, which was constructe in 1945 for housing administration storage. The Navy constructed Building 271 in 1945 as a semi-permanent building. Building 271 was used for gas cylinders storage and general storage including vehicles, chemicals, empty drums, and recycling. There have been no additions to the building.[4]

Building 271 is one of the many storage type properties at NAS Alameda. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include storage sheds. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[5]

Evaluation

Building 271 was built during World War II operations at NAS Alameda, and is part of the broader fleet support functions of the station during that time. Although Building 271 has some association with the district's significance under NRHP Criterion A (CRHR Criterion 1), the alterations to the area of the station where the building is located prevent it from conveying its association with the World War II context. Furthermore, Building 265 is an undistinguishable example of a common building type and does not convey any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-

> contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[6]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Additionally, Woodbridge did not evaluate some buildings, like Building 271. It is relevant to also place this building among the resources that were considered to be an area of the station that was so altered through multiple changes over time that it no longer conveyed the impression of the early air station and did not contribute to the district. Early plans for the station do not include some support / storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. These included magazines, the salvage facility, the locomotive repair shop, storage (like Building 271), and engine test cells. Research undertaken for this project in building plans, base maps, and aerial photographs indicates buildings that this area was not a part of the original formal station plan and that the area east of the Seaplane Lagoon on NAS Alameda was part of early plans for future expansion.[7] It is also within an area of the station that includes buildings that have been relocated, altered, and newly constructed during the Cold War period. The area, which includes Building 271, therefore, does not convey its association with the context of World War II naval facilities in the Bay Area, and is not a contributing element of the historic district.

In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). This building was unremarkable in its use in routine material supply, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 271 is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This building does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). This building is not within the identified NAS Alameda Historic District and does not have sufficient historical significance or design elements to justify expanding the district to include Building 271.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8]

NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Building 271, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 271 provided storage of gas cylinders necessary for aircraft and shop operations. It is not directly associated with significant activities of the Cold War.

Building 292 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Building 292 was constructed within the period of significance of the NAS Alameda Historic District (1938-1945) identified by Sally B. Woodbridge in 1992; however, it is not within the district boundaries and was not evaluated as a potential contributor. This form was prepared to: 1) re-evaluate the eligibility of this building within the World War II-era historic context for the station, assessing whether the building is historically significant and should be included in the NAS Alameda Historic District; and 2) to evaluate the building's significance under Cold War themes. (See Continuation Sheet.)

***P3a. Description (cont.):**

The east end has another entry consisting of a solid wood door with wooden stoop and protective shed roof. Both the east and south ends have two one over one, double-hung windows. The south side of the east west portion of the 'L' has a shed roof that changes the angle of the gable and projects beyond the regular width. The southern edge of the shed roof is supported on posts. These posts create bays for the storage of equipment and material.

The shed roof extension along the north side has horizontal wood siding with metal gutters and a ground level vehicle entrance on the west side with a wooden sliding door; the north side of the shed has wood framed hopper windows. (**Photograph 2**). The south side or rear of the building appears to be a work/storage area and is enclosed behind a chain-link security fence with a rolling gate on the north side (**Photograph 3**).

B10. Significance (cont.):

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 292 was constructed in 1945 as an inspection repair operations building at a cost of $9,000. Since 1945 crane and rigging work, along with marine maintenance has been performed in the shop area on the north side of the building as well as in the open area on the building's south side (**Photograph 2**). These crane tracks (Building 201062) that run east of the building to Pier 3, are recorded on a separate form. The tracks were originally constructed in 1940 to service Pier 2; they were extended to Pier 3 when it was built in 1945. The Colby Porter Crane, which ran along the tracks in the 1960s and assisted in loading and off-loading vessels, was operated out of Building 292. In late 1967, the engine of this crane was replaced.[1] Segments of the track have been removed in some areas (**Photograph 3**). The larger area of Building 292 historically and currently provides office space for personnel coordinating the functions of the nearby facilities.[2] The space occupied by Building 292 was formerly an open area used for airplane and missile storage.[3]

*Recorded by: R. Herbert and K. Clementi Date: October 8, 2009 ☒ Continuation ☐ Update

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[4]

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. Building 292 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Evaluation

Building 292 was built in the final year of World War II operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time and throughout the Cold War. Although Building 292 has some association with the district's significance under NRHP Criterion A (CRHR Criterion 1), the alterations to the area of the station where the building is located prevent it from conveying its association with the World War II context. Furthermore, Building 292 is an undistinguishable example of a common building type and does not convey any potential architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated:

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[5]

The buildings considered not eligible as contributing elements of the district were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Additionally, Woodbridge did not evaluate some buildings, like Building 292, that were considered temporary or miscellaneous, or nondescript. It is relevant to also place this building among the resources that were considered to be an area of the station that was so altered through multiple changes over time that it no longer conveyed the impression of the early air station and did not contribute to the district. Early plans for the station do not include some support

[4] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.
[5] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," 1992, 1-2, 11-12.

/storage facilities or facilities that required siting and design input from specialized departments. As dictated by their secondary function and/or for safety, some facilities were not placed within the formal hierarchal planning of the station's major functions or were placed away from more densely occupied portions of the station. Research undertaken for this project in building plans, base maps, and aerial photographs indicates buildings that this area was not a part of the original formal station plan and the area was developed during wartime expansion.[6] It is also within an area of the station that includes buildings / structures that have been altered and newly constructed during the Cold War period. The area, which includes Building 292, therefore, does not convey its association with the context of World War II, and is not a contributing element of the historic district.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Navy operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Navy facilities around the nation.[7] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Though the function of the building was associated with operations at the Carrier Piers, the routine marine and crane maintenance and repair that occurred within the building was not historically significant, nor were the loading and unloading operations that occurred on the crane tracks adjacent to Building 292. The building retains integrity to when it was built; however, it is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 340 is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

The Navy constructed Building 340 in 1949 as part of a larger high-pressure fire protection system which would provide additional fire protection to ships berthed at Piers 1 and 2. Building 340, the pump house, contained booster pumps which would raise the pressure in the surrounding domestic water and high pressure mains and hydrants.[2]

Evaluation

Building 340 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945possesses

significance in the Cold War period. In the larger context of the naval operations in California and nationwide during this period, the Public Works / Infrastructure function of Building 340 did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Thus, while it retains some integrity to when it was constructed, Building 340 was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Building 340 is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). It does not have a direct or important association with a historically significant individual, and not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

The Navy previously evaluated Building 346 in 2007 to support a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) response action. The Navy concluded that the building did not meet the criteria for listing in the National Register. The California SHPO concurred with this finding on December 3, 2007 (USN0700912B). For reference, the Navy's DPR 523 site form is attached.

Building 346 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

This form has been prepared to reaffirm the Navy's previous conclusion based on the station wide evaluation of Cold War-era resources prepared as part of the study referenced in P11.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 346 did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Station Forces constructed Building 346 in 1949 to serve as an electric shop associated with the aircraft Overhaul and Repair department. This semi-permanent building was used as a generator test electric shop, a general repair shop, administrative office, and lunch and locker room. The personnel doors were replaced sometime after 1958. As of 2001 this Quonset Hut stored furniture, supplies, and tools.[2]

Evaluation

Building 346 was built during the Cold War-era operations on NAS Alameda, and is part of the broader fleet support functions of the station during this period. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building appears to retain some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

NOTE: Subsequent to preparation and release of the draft of the evaluation report noted in field P11, the Navy demolished this building in September 2010.

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Address integrity.)

Although a formal survey and evaluation of Cold War-era eligibility has not yet been completed for all buildings and structures built between 1946 and 1989 at the former NAS Alameda, Navy records and preliminary contextual data provide a basis for evaluating Building 346. Based upon this data, Building 346 does not appear to meet the criteria for listing in the National Register of Historical Places.

With the end of WWII, the Twelfth Naval District retained Naval Air Station Alameda as one of three permanent stations within its jurisdiction. NAS Alameda became responsible for processing material, equipment, and personnel during the postwar demobilization from the Pacific Theater. Personnel at NAS Alameda began the process of decommissioning ships, mothballing planes, and melting scrap metal from the war effort. (See Continuation Sheet.)

(This space reserved for official comments.)

DESCRIPTION (continued):

Building 346 is approximately 2,424 square feet in size and measures approximately 41 feet wide by 60 feet in length. Measuring 21 feet in height, Building 346 is a Quonset Hut constructed of corrugated galvanized steel over a steel frame with a mesh steel covering affixed to the interior walls. Building 346 rests atop a concrete pad. (Photograph 1). On the primary façade, a central, industrial steel door is flanked by paired six-light, industrial sash windows. A single personnel door and vent also appear on the primary façade.

SIGNIFICANCE (continued):

Immediately after the war, the installation also served as a supply depot, sending the required staff, materials, and food to Occupied Japan. In the postwar years, NAS Alameda also continued with the overhaul of aircraft as the station converted its focus from propeller-driven aircraft to work on jets. [1]

The initiation of the Korean War and the political context of the Cold War in the 1950s and early 1960s brought additional mission requirements and infrastructure expansion to NAS Alameda. Marines affiliated with Alameda-based carrier divisions were some of the first American ground troops to engage in combat in Korea. NAS Alameda also saw increases in personnel, expansion of runways, and the homeporting of the some of the largest aircraft carriers in the world during this period. By 1961, however, the last seaplane squadron had been transferred to NAS Whidbey Island and several jet squadrons had been reassigned to NAS Lemoore to avoid the noise of jet training over the growing San Francisco Bay Area.

With the escalation of American involvement in the Vietnam War, NAS Alameda became homeport to the USS Enterprise, the world's largest aircraft carrier at the time and the first to be nuclear-powered. Additionally, half of the attack carriers in Vietnam during the late 1960s were reportedly homeported at Alameda. The Naval Air Rework Facility (NARF) also continued to support the maintenance and repair of aircraft in the Vietnam period.

After the end of Vietnam, NAS Alameda saw a reduction in the mission requirement for the NARF and its successor entity, the Naval Aviation Depot, Alameda (NADEP). NAS Alameda was considered twice for closure in 1985 and in 1990, despite the generalized military buildup of the 1980s. NAS Alameda remained active until it was selected for closure in 1993, and operations ceased in 1997 with operational closure.

Building 346 has been used as maintenance shop, Drop Tank cleaning shop, electrical shop, and materials laboratory. In addition, Building 346 has also been identified as a storage building for radioactive waste including radium, depleted uranium, and cesium. [2] Given the proximity to Building 5, Building 346 may have been associated with processing material to support the overhaul of aircraft.

---

[1] This historic context statement is summarized from Page & Turnbull, Inc., *Preliminary Development Concept; Appendix B: Alameda Point Naval Air Station Historic District Assessment and Historic Preservation Strategy; Prepared for the Alameda Reuse and Redevelopment Authority*; (February 2006). The Cold War historic context in Appendix B was prepared for use in redevelopment planning and not for evaluation of National Register eligibility.

*Recorded by Erica Spinelli *Date September 6, 2007 ☒ Continuation ☐ Update

Although Building 346 served several support functions for NAS Alameda throughout the Cold War period, this structure served logistical and perhaps industrial functions and does not appear to have had direct or important associations with the significant events and themes of the Cold War such as weapons or aircraft research and development (Criterion A). As a Quonset Hut, Building 346 is a standard, utilitarian construction type and does not reflect important architectural themes or styles (Criterion C). Research does not indicate any associations with significant people (Criterion B) or the potential to yield important information in the future (Criterion D). As a logistical and industrial support structure without important architectural features, Building 346 does not appear to meet the criteria for listing on the National Register.

Built on a concrete slab, Building 347, measuring 1,197 square feet, is a one-story building with a 34 x 34 foot square plan located on the west side of Building 5. The panel-formed concrete building has a parapet roof with metal flange and exterior venting on the roof. The north, south, and west sides of the building each have a pair of galvanized metal double doors with strap hinges covered by a concrete shed roof canopy **(Photograph 1)**. These doors are the building's only openings; there are no windows. Other exterior features include a small concrete ramp approach to the western doors, louvered vents at the southwest and northwest corners, and an exterior ladder at the southwest corner. A wooden plank walkway connects the roof of Building 347 to Building 5 **(Photograph 3)**.

The former Paint Storage (Building 347) is not eligible for listing in the National Register of Historical Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

B10. Significance:

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 347 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Station Forces constructed Building 347 in 1946 to serve as the paint storage and mixing room associated with aircraft maintenance. This semi-permanent building was also used as a general purpose manufacturing and repair shop. Building 347 appears unaltered since its original construction and remains connected via ducting to Building 5.[1]

Evaluation

Building 347 was built during the Cold War-era operations on NAS Alameda, and is part of the broader fleet support functions of the station during this period. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building appears to retain some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 372 is a tall, single-story building measuring 18,513 square feet with a rectangular plan and flat roof. It is constructed of concrete and has two large metal exhaust towers connected to individual test cells inside the building, protruding from the west side. There are two, full-height metal roll-up doors on both the east and west sides of the building. Above these roll-up doors are low parapets on the roofline. It does not appear the doors on the west side are currently operable **(Photograph 1)**. Between the roll-up doors on the west side is a metal double door; two, three-over-three awning windows; and metal louvered vents. Between the roll-up doors on the east side is a smaller metal roll-up door, metal personnel door, and metal louvered vents **(Photograph 2)**. On the south side of the building is a small attached corrugated metal shed with a shed roof. It has wood double doors and a louvered vent near the roof. Built on top of the roof is another small, corrugated metal shed.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Stolte Incorporated and Gallagher & Durke Incorporated, both of Oakland, constructed the Turbo Prop Test Cells (Building 372) in 1953 for a total cost of $600,732.97. The facility was constructed with material to dampen the amount of noise produced by engine testing. Additionally, these test cells were equipped with closed circuit televisions to monitor the tests from the second floor, centralized control room. The two test engines are located in the north and south sections of the building and each are connected to exhaust towers. Fuel was pumped into the building via underground pipelines entering the building from the west and the lubricant supply was stored within the western central portion of the building. The small extension on the south side housed electrical and support equipment.[1]

Testing within Building 372 was part of the larger Overhaul and Repair (O&R) Department's Engine Overhaul Division on base. Funding for jet engine test cells began as early as 1949, but was not granted until the expansion of the navy base began in 1951. Building 372 was one component of this larger funding project. The new technology associated with powerful jet engines were the basis for this expansion and new facility. Although the Turbo Prop Test Cells were constructed with innovative noise dampening materials, a reevaluation of the Station Air Installation Compatible Use Zone (AICUZ) in 1981 contributed to modifications to test cells conducted later that year.[2]

Some of the external recent modifications to Building 372 include changes to the tower and pipe structures associated with the testing process. A small pipe originally ran downward from the west side of the building between the two towers; this pipe was used for air intake required for testing. The exhaust towers remain the same but catwalks have been added to the upper portions of both of them. As of 2008, Building 372 was divided into three main sections: a 1,920 square-foot engine preparation and storage area, the 15,858 square-foot test cells, and a 735 square-foot plant services section for aircraft overhaul.[3]

Evaluation

Properties significant under the Cold War theme are related to the development, testing and evaluation of new technologies or operations overseas. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] Building 372 was used to test jet engines, but no significant technological advancements occurred at this facility. Buildings 372, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHP Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHP Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHP 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Building 380 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 380 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Other functions in this category include honorary / ceremonial purposes such as flagpoles and saluting batteries. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 380 is a series of three anti-aircraft guns on a concrete slab that were installed at the southeast corner of the Control Tower (Building 19) in 1954. A saluting battery is a presentation of arms to salute, honor and recognize visitors to a military base and associated with morale. A battery can be composed of weapons as well as personnel that operate those weapons. Since the airfield was a Naval Air Station it would be possible that these were placed near the control tower at the airfield for that purpose. [1]

Two of the guns are Mark 22 versions of the 3-inch 50-caliber guns that were manufactured by United States Naval Ordnance Plant 'F' in Louisville, Kentucky in 1944 **(Photograph 2)**. The 3-inch 50 caliber Mark 2 gun was manufactured by the General Motor Corporation in Detroit, Michigan in 1943 for the United States Navy Bureau of Ordnance **(Photograph 3)**. The types of guns were used as anti-aircraft weapons on Naval vessels such as carriers and submarines.[2] Research did not reveal which ship / vessel the guns served, nor who ordered the placement of the guns at Building 19 on NAS Alameda in 1954.

Page 4 **of** 5 ***Resource Name or #** (Assigned by recorder) Building 380

***Recorded by:** C. Brookshear and S. Miltenberger ***Date:** September 29, 2009 ☒ **Continuation** ☐ **Update**

Within a week after the attack on Pearl Harbor in December 1941, American automotive manufacturers were charged by the federal government to produce more than one-third of all machine guns needed for war time demand. William S. Knudsen, General Motors president, was the mastermind behind the reconversion of the auto industry to manufacturing war time materials for the military.[3]

Evaluation

Building 380 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It is not known where the guns were obtained. Though the building retains integrity to when it was built, it was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The building is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations of the period (NRHP Criterion C / CRHR Criterion 3). Building 380 did not have a direct or important association with a historically significant individual, and not is likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). As solely commemorative objects of World War II, the guns themselves do not possess significance based on their own importance (NRHP Criterion Consideration F). In closing, Building 380 does not possess historic significance and is not a contributing element of the NAS Alameda Historic District.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Although it was not in their contract to supply and erect a flagpole, Johnson, Drake and Piper erected the flagpole in front of Building 1 three days before the commission date of the Station. A messenger was sent to Mare Island for a flag to use during the commissioning ceremony on November 1, 1940. Between 1953 and 1956 a yardarm was added to the pole. [1]

Evaluation

The flagpole was built during World War II operations on NAS Alameda, and is part of the broader honorary functions of the station during that time for daily and ceremonial use. In the larger context of the naval operations in California and nationwide during this period, the function of this structure did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Individual buildings and structures constructed during the World War II-era and used during the Cold War are not imbued with significance simply because they were part of NAS Alameda operations and functions during these period. Building 384, the flagpole, is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The structure did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era. It was unremarkable in its use and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely functional in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This structure does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). The structure is thus not considered a contributing resource of the NAS Alameda Historic District.

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Thousands of Quonset huts were built in the United States starting in World War II. Their design was based on the Nissen Bow Hut first built by the British military during World War I. Named for their place of manufacture, the Davisville Construction Battalion Center at Quonset Point Naval Air Station, Rhode Island, several other companies became involved in manufacture of this building type including Stran Steel, the Anderson Sheet Metal Company and Armco International Corporation of Middletown, Ohio. Armco was the company that manufactured a heavy ingot iron building which was modeled on earth-retaining structures similar to storm sewers or culverts. Armco Huts were used for both ammunition magazines as well as personnel shelters. Armco Huts needed no rib supports and were strong enough to be buried under six feet of earth.[2]

Building 388 was a salvage ARMCO hut constructed in 1950 by Station Forces at the north end of the airfield. The building was used as inert storage and is in its original location.[3]

Evaluation

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] Building 388 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It is unremarkable in its use in routine fleet support, and not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda building is largely utilitarian in design, materials, and construction methodology and relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It is typical of pre-engineered Cold War era storage facilities located on military bases. The building does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

Building 391 is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 391 was constructed by Station Forces in 1950 as a semi-permanent salvage building located at the east side of the Public Works Building 114. During the 1960s and 1970s it was used for storage and warehouse space. No other information was discovered about the building.[2]

Evaluation

Building 391 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a

historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although it retains a measure of integrity from it was constructed, it is unremarkable in its use in routine fleet support, and not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda building is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It is typical of Cold War era storage facilities located on military bases. The building does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 391 is not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 392 did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique to NAS Alameda or the military and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Building 392 was constructed by Station Forces in 1956 as an Emergency Generator House behind the Radio Transmitter Building (35).[2] Research revealed no further information about this building.

Evaluation

Building 392 was built during the Cold War-era operations on NAS Alameda, and as a part of the infrastructure serving the station during the period. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Building 392 is required to support urban activities, and its ubiquitous nature renders it

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible. O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy. The development of new technology associated with faster aircraft resulted in the need for new facilities to relieve overcrowding in the O&R department during the 1950s.[1]

Station Forces constructed Building 393 in 1953 as a temporary building to support the primary O & R functions. Originally, the building served as a refueler repair shelter but has also served as a maintenance shop, supply storage, painting and blasting shop for marine maintenance and in 2001 stored replacement parts for boats and trailers. In 1987 the vent system in Building 393 was rehabilitated for a total of $99,000. The boarded up window and wall opening on the west side are the only apparent modifications to the building, which remains in its original location.[2]

Evaluation

Building 393 was built during Cold War era operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the support function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building

retains some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

Building 397 is a 17,335 square foot irregular shaped, multi-component building with a flat roof. The building's shape and massing clearly reflect its function as a jet engine test facility. On the west end facing Orion Street is a tall, rectangular, concrete block component with metal double doors flanked by two metal roll-up doors. Moving east from this component are two identical long, narrow components. From west to east these each consist of a long, narrow concrete building with two tall ventilation towers. One is concrete with a trapezoidal metal top with open sides, the other is made of raised ridge metal sheets and has a catwalk around the top (**Photographs 1, 2**). (See Continuation Sheet)

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***P3a. Description (cont.):**

East of this component is a long, corrugated metal cylinder about ten feet in diameter. At the east end of the cylinder is another narrow concrete building below a raised ridge metal ventilation tower with a catwalk and sloping shed roof. Between these two narrow, linear components is a single-story concrete building with a flat roof. It has a pair of metal personnel doors on the east side, and a metal overhead door and metal sliding door on the west side (**Photograph 4**). Connecting the concrete block component on the west end with the rest of the building is an open walkway covered by a flat roof.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible.[1]

The development of new technology associated with faster aircraft resulted in the need for new facilities to relieve overcrowding in the O&R department during the 1950s. Building 397 was part of a $3.5 million construction project authorized by the Bureau of Yards and Docks in 1957. Shaw & Estes of Dallas, Texas began construction of the Turbo Jet Test Facility in 1955. The four year construction finalized with the testing of J-65 correlation engines in the spring of 1959. Henry Kaiser Company's design of the building muted the normally loud sound of engine testing through the use of concrete masonry unit and one to two-foot-thick reinforced concrete walls. Additionally the exhaust stacks included sounds attenuation material to quiet the sounds of engine testing.[2]

The Turbo Jet Test Facility included an engine preparation room and storage area on the west side, a centrally located control room between the two large test cells containing a total of 16 smaller cells, and an eastern equipment and fuel rooms. When an engine was wheeled into a test cell, three 4-inch thick interlocking steel doors were closed to isolate the cell. As part of noise abatement, the doors were filled with acoustic material and sealed with sponge rubber to keep the noise of the engines from filtering to the outside. Two of the towers intake air to help run the engine and the other two towers release exhaust from the tests. External components included a 50,000 gallon water reservoir that served as a cooling system and a buried 25,000 gallon fuel storage tank to run the engines for testing. Engineers controlled the tests remotely through the control room and monitored the testing process on television screens

connected to cameras located within the cells. This use of a closed circuit television was new technology for the late 1950s.[3]

Testing within Building 397 was part of the larger Overhaul and Repair (O&R) Department's Engine Overhaul Division on base. The cells tested both new engines, such as the J-65 correlation engine, direct from the factory as well as overhauled engines on base, including J-71 engines. Various components of the engines were tested in this facility including thrust, vibration, and tail cone temperature, which could take up to two hours per engine. An engine had to pass testing in Building 397 to receive a NAS Alameda decal indicating its readiness for use, which typically meant the engine was stable enough to propel a plane to the sound barrier.[4]

In April 1967, NAS Alameda's O&R Department was eliminated and replaced by a new command, Naval Air Rework Facility (NARF). The end of the Vietnam conflict and new engines requiring more advanced technology slowed down work for NARF. By the mid-1980s commercial competition also impacted the amount of work undertaken by NARF divisions.[5]

Building 397 was modified in 1985, which included the addition of two more centrally located stacks. Test Cells 15 and 16 were reconstructed with the addition of the center stacks to allow for Correlation Testing of engines, which is essentially engine calibration. The reconstructed Test Cells also reduced noise as part of a requirement of the Bay Area Air Management Quality District. The intake tower hoods have also been replaced and the exhaust stacks now have hoods on top. The catwalks around the exhaust stacks are also later additions, but the specific date of construction could not be determined. The building remains in its original location and the current building record divides the facility into three main sections: a 1,920 square-foot engine preparation and storage area, a 14,721 square-foot engine test cell, and the small 694 square-foot plant services section for aircraft overhaul.[6]

Evaluation

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7]

Building 397, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 399 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Building 399 was constructed in 1957 by contractors Swinerton & Walberg of Oakland with A&E services by Kaiser Engineers as a permanent compressor building. The exterior and roof of the building was clad in corrugated asbestos siding, but both were replaced with metal by 1963. Two 1,000 horsepower air compressors with air heaters were originally installed in the building to supply Air turbine overhaul and testing (Building 398). The compressed air produced in the building supplied the Overhaul and Repair Department, including the aircraft engine test cells in nearby buildings. Between 1957 and 1963 the building was expanded at the north end of the building from 46'10" x 42'9" to 60 x 44 feet. Another expansion between 1963 to 1968 brought the building to its present size of 112 x 44 feet. In 1968 a water tower was installed to cool the existing air compressors and work was begun to replace the two existing air compressors to double the capacity from 9,100 to 13,000 cubic feet per minute.[2]

Evaluation

Building 399 was built during the Cold War-era operations on NAS Alameda, and is part of the broader fleet support functions of the station during this period. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the building retains little integrity to the time it was constructed because of subsequent modifications and expansions.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 405 was completed in December 1956 (and given a 1957 construction date in Navy building records) as an Aircraft Component Storage building near the southwest corner of Building 5. The building has been used as a non-chemical shipping area, and storage of hazardous materials and wastes. Later, the building was used for ground support equipment re-work. [2]

Evaluation

The history of the station during the Cold War illustrates that neither the district, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played a key role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation. Building 405, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), nor an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2), nor does it exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3). The building is not likely to reveal important historical information (NRHP Criterion D / CRHR Criterion 4).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 414 was completed in 1957 as a chemical storage building, which appears to have been its sole use.[2] No other information was revealed about the building in the written record.

Evaluation

Building 414 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although it retains a measure of integrity from when it was constructed, it is unremarkable in its use in routine fleet support and not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda building is largely utilitarian in design, materials, and construction methodology and relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It is typical of Cold War-era storage facilities located on military bases. The building does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 585 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

The outdoor barbeque Building 419 was constructed adjacent to the Commissioned Officer's Club (Building 60) courtyard in 1956 to support the recreational activities provided by the club.[1]

Evaluation

Building 419 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building retains some integrity to when it was built, but is unremarkable in its use within routine fleet support, and was not historically

important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for buildings constructed during the 1980s at naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

The Navy previously evaluated Building 459 in 2009 to support a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) response action. The Navy concluded that the building did not meet the criteria for listing in the National Register. The California SHPO concurred with this finding on October 15, 2009. For reference, the Navy's DPR 523 site form is attached. Since completion of the fieldwork for the current evaluation, the Navy has moved forward with the CERCLA response action, including soil removal and partial demolition of Building 459.

Building 459 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

This form has been prepared to reaffirm the Navy's previous conclusion based on the station wide evaluation of Cold War-era resources prepared as part of the study referenced in P11.

***P3a. Description (cont.):**

The east west wing is clad with grooved wood siding and a corrugated metal roof. The wing has open eaves on the east end and adjoins the other wing at the west end. Vertical boards divide the elevations into bays. The south side of the wing has a row of seven horizontally divided, metal frame windows toward the east end. A plywood boxed awning over a pair of metal and glass entry doors is centrally located with a pair of fixed three light windows and a single three-light to the west. A glass and metal door is located at the west end with a two-light window to the east **(Photograph 2)**. The west end of the wing has two metal personnel doors flanking a three-light window. The area on the north side of the wing is fenced off **(Photograph 4)**. The north side of the wing has and irregular mix of personnel doors, two part sliding windows, and overhead doors. The largest overhead door located near the center has a metal awning. A metal awning on metal posts is located to the east covering and outdoor workshop area.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 459 did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

CONTINUATION SHEET **Trinomial**

Page 4 **of** 6 ***Resource Name or #** (Assigned by recorder) Building 459

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 12, 2009 ☒ **Continuation** ☐ **Update**

Building 459 was constructed in 1962 as the Navy Exchange Service Station and Garage and contained an area for do-it-yourself projects; a canopy was constructed later the same year.[1] Between 1963 and 1968 the majority of the building was used as a Navy Exchange Auto Parts store and the service station occupied only 1,000 square feet of the 11,493 square foot building. In 1978 the building was completely renovated by Navy Exchange personnel continuing a trend of self help projects. The sales area of the building was expanded 40 percent, the stockroom/warehouse was increased 200 percent, and handicap access was provided.[2]

Evaluation

Building 459 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building does not retain integrity to when it was built through the demolition of part of the building, was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The building is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations of the period (NRHP Criterion C / CRHR Criterion 3). Building 459 did not have a direct or important association with a historically significant individual, and not is likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while the Navy Exchange Service Station served a useful function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This building is not eligible for listing in the NRHP or CRHR because it does not individually possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles during the Cold War era.

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible. O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy.[1] O&R and later NARF was among the largest tenants on NAS Alameda occupying numerous buildings with main operations centered in Building 5.

In 1963 J. Cornish drafted the plans for Building 494, which included a locker room and general office in the northern portion, a central open storage area and the control center and storage in the southern third. The Bureau of Naval Weapons was both the financier and management bureau for the building. Building 494 was constructed at a cost of $25,498 to serve as an Overhaul and Repair (O&R) office and maintenance building.[2] Building 494 remains in its original location and appears unaltered aside from the boarded up windows.

Evaluation

Building 494 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did

not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the O&R function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Though the building retains integrity to when it was originally built, the building is unremarkable in its use in routine fleet support, and is not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 494 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

BUILDING, STRUCTURE, AND OBJECT RECORD

Page 3 **of** 4 ***NRHP Status Code** 6Z

***Resource Name or #** (Assigned by recorder) Building 500

***P3a. Description (cont.):**

The south end of the building is enclosed and has metal personnel door with single lights on the north, south, and east sides, each with a small concrete landing with metal pipe railing. Windows are six pane throughout most of the building with a single plate window on the north side of the enclosed element **(Photograph 3)**. The windows and door on the south side have metal awnings **(Photograph 4)**. The north side of the building has an exterior exhaust or vent system through north side wall.

B10. Significance (cont.):

The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The U.S. Navy constructed Building 500 in 1964 for a total cost of $23,352. This approximately 4,000 square foot building primarily served as a receiving shelter. Building plans from 1966 show internal divisions of the south side of building to include two office spaces. The main open-sided area was used as an equipment shop, while the two smaller areas included an administration office and combined locker and snack room.[1] The building appears unmodified from its original construction.

Evaluation

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] Building 500, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), nor an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2), nor does it exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3). The building is not likely to reveal important historical information (NRHP Criterion D / CRHR Criterion 4). Furthermore, while Building 500 served a valuable function within the NAS Alameda facility during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Building 500 does not possess historic significance and is not a contributing element of the NAS Alameda Historic District.[3]

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the postwar years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings and structures constructed during the Cold War era, or World War II-era buildings and structures used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. Building 512, located on the south end of Runway 13-31, served a necessary purpose as a dolphin. Yet, this structure did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Building 512 was constructed in 1964 as a semi-permanent structure on the south end of Runway 13-31. Dolphins typically consist of a cluster of piles secured together by wire, and are intended to prevent ships from colliding with waterfront structures. Building 512 was a more-elaborate dolphin; the 30 square-foot wooden structure served as a ship beacon until base closure in 1997. [1] Building 513, located at the east end of the dolphin operated and Building 514 (located on the airfield) were constructed in 1964 as a two-part wheels-up and wave-off runway lighting system. The purpose of the lighting system is to signal the pilot preparing to land if the landing gear of his aircraft has been lowered. The wheels-up lights illuminate the underside of the aircraft to enable a wheels-watch stationed in the approach zone to determine if the landing gear is fully lowered at night. The watchmen on NAS Alameda was stationed in the small building located on the dolphin (Building 512) at the south end of Runway 13-31 with white approach lights on the dolphin. Wave-off lighting signals the pilot during the day and night if the landing gear is not lowered. The wave-off lights are equipped with red filters and face landing aircraft.[2]

Many buildings and structures on NAS Alameda, such as Building 512, fall within the "Waterfront Operations" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include piers, wharfs, dolphins, diving lockers, maintenance shops, crane tracks, and navigation range lights. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. These buildings are utilitarian and many are of prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, these buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context

Evaluation

Building 512 was built in the midst of Cold War operations on NAS Alameda, and was part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Waterfront Operations function of the dolphin did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Moreover, while the structure retains integrity to the period when it was constructed, it was unremarkable in its use in routine fleet support, and was not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The dolphin is purely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). It has no direct or important association with a historically significant individual, and is unlikely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, although Building 512 served a necessary purpose on NAS Alameda during the Cold War era, its construction and use is not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 517, the Navy Exchange Beverage Store, is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 517 was constructed in 1968 as the Navy Exchange Beverage Store and covered 3,200 square feet.[1] In 1972, the building added a 5,500 square foot addition and the hardware and garden departments were moved into this new "Mini-Mart" from their previous location at the main retail store. The Navy Resale System Office made the expansion possible through the approved use of non-appropriated funds.[2] The expansion was one of the projects undertaken by the Seabees and Self-Help personnel beginning in 1971.[3] In recent years Building 517 has primarily been used as the garden shop, though it remained classified as the Navy Exchange Beverage Store when the base closed in 1997.[4] The side lights around the former double door entrance have since been boarded over, as have the doors themselves; however the remainder of the building is intact according to its original construction and addition.

Evaluation

Building 517 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it retains some integrity to when it was built, the building was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Built as a beverage store, the building expanded to include garden and hardware departments, and continued in its role as an unexceptional fleet support building. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). Pre-fabricated buildings, like the one recorded here, were widely used in naval facilities during the Cold War period. This facility does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 517 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

P3a. Description (cont.):

Concrete ramps lead up to the main entrance on the east side, the freight doors on the south side, and the double metal doors on the west side. Flush metal personnel doors are located on the west and south sides. The main entrance is composed of metal frame glazed doors flanked by fixed transom windows. Aggregate stucco planter boxes decorate the base of the east side façade.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 525, the Bowling Lanes, is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 525, the base's 24-lane bowling alley, was constructed in 1970 at a cost of $742,600 without the use of appropriated funds. The air station utilized a loan from the Bureau of Naval Personnel Special Service to pay for the building's construction, which began in February 1970 by the Werner-Herbison-Padgett Co., general contractor for the Brunswick Corporation. The new bowling alley was outfitted with 24 lanes of Brunswick equipment, a Navy Exchange snack bar, locker room, and meeting facilities all of which opened on July 24, 1970. Since its opening, the bowling alley remained self-sufficient, paying off the initial loan from its proceeds. In 1974 the center's Resale and Pro Shop was expanded to include the purchase and drilling of bowling balls. The bowling alley served military personnel and their dependents along with Department of Defense civilian employees.[1] The building has been

modified since its construction. The north side now has three infilled, former freight doors and the south side has an infilled, former personnel door. Available building records do not disclose when these alterations were made.

Evaluation

The Bowling Lanes building was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. As a bowling alley, Building 525 played an unremarkable and typical role in support of base personnel. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). The primarily concrete building represents typical utilitarian construction, used widely on military installations. As a facility that was used and staffed by a large number of people, it does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). The construction and use of Building 525 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Moreover, the alterations that have been made to the doors on this building have diminished the integrity of design, materials and workmanship. Building 525 does not possess historic significance and is not a contributing element of the NAS Alameda Historic District.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 527, the Credit Union, is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 527 was built in 1970 by The Bank American Trust Company and Federal Employees Credit Union which was previously located in Building 62. The credit union operated out of Building 527 and then opened another branch off-base to facilitate more efficient service to its growing membership.[1]

Evaluation

The Credit Union building was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it retains some integrity to when it was built, it was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. As a credit union, Building 527 played an unremarkable and typical role in support of base personnel. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). The primarily concrete building represents typical utilitarian construction, used widely on military installations. As a facility that was used and staffed by a large number of people, it does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 527 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

The Line Shack (Building 540) is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Building 540 was constructed in 1975 to serve as a line shack in the hangars area; it has also been reported to house a diesel generator. The aboveground storage tank located next to the building provided fuel to the generator within Building 540.

Evaluation

Building 540 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although it retains a measure of integrity from when it was constructed, it is unremarkable in its use in routine fleet support, and not historically important within the context of station operations or within the larger historical context of

B10. Significance:

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 544 is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during Cold War era operations.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Building 544 was constructed in 1974 east of Hangar 41 to serve as a liquid oxygen and nitrogen facility for jet engine fueling / maintenance. Building 544 remains in its original location.[2] The boarded up windows on the building are part of a protection program by the Navy as part of their layaway program, and do not affect the integrity of the building.

Evaluation

Building 544 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War. In the larger context of the naval operations in California and nationwide during this period, Building 544 did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Building 544 was unremarkable in its use in

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This bus station, Building 546, is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The structure did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 546 was constructed in 1974 as a semi-permanent bus station. It remains in its original location and no apparent modifications have been made to the structure.

Evaluation

This bus station was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[1] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this structure did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station

The Pavement and Grounds Shelter (Building 550) is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 550 was constructed in 1974 as a semi-permanent structure to store grounds equipment west of Building 428. By 2001, a maintenance contractor was using the almost 2,000 square-foot metal structure. The building remains in its original location and the plywood doors may be modifications from the original building.

Evaluation

Building 550 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the storage function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although it retains a measure of integrity from it was constructed, it is unremarkable in its use in routine fleet support, and not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda building is largely utilitarian in

P3a. Description (cont.):

The west side is composed of three sections with a metal personnel door in the middle section. A rectangular louvered vent is located at the north end of the southern section with a metal personnel door next to a corrugated metal overhead door at the southwest corner. The south end of the building has two security lights and a Christian cross **(Photograph 3)**. The east side has a metal door on the southwest corner with an electrical meter box.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. The former Package Store, Building 564, is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Members of CB-426 and NAS Self-Help Division began construction of the Package Store in April 1974 and it was opened in March 1975. The construction of the building aimed to combine all existing off-sale liquor stores on the base, including the store across the street from the Officers' Club and at the Chiefs' Club. The original building had 4,000 square feet of sales floor, 2,000 of which was a carpet wine cellar. With the consolidation of the two liquor stores, sales and volume of the Consolidated Package Store increased 80 percent during the first year of operation, which was the highest gross profit percentage of package stores in the Bay Area. Between 1975 and 1988 the south end of the building was extended. In 1992 the Package Store moved to the Main Exchange in Building 118 to reduce operating costs and extend hours of operation.[1]

Evaluation

Building 564 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it retains some integrity to when it was built, it was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. As a liquor store, the building performed a typical support role found on military bases. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). The primarily concrete building represents typical utilitarian construction used widely on military installations. As a facility that was used and staffed by a large number of people, it does not have a direct or important association with a historically significant individual, nor is it likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 564 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

***P3a. Description (cont.):**

On the south side of the main building there are three large metal air scrubbers connected to the building by metal pipes. The scrubbers are attached from the south side to three metal four-story smoke stacks which have enclosed vertical ladders leading up to a metal platform with handrails which encircle the top of the stacks **(Photograph 1)**. On the north side of first floor of the main building there are two freight bays with metal roll-up doors. There are three sets of louvered metal vents running vertically, two of which run the full length, from the second story to the top of the parapet. The third set of vents, farthest west, runs from the top of the smaller attached building to the top of the roof parapet **(Photograph 2)**. Attached to the northwest corner of the main building there is shorter building with solid metal personnel doors on the north and west sides. On the east side there is a setback and another part of the building with a low shed roof which sets on a concrete slab. This extension has a small horizontal metal overhang which shelters a latched metal door **(Photograph 2)**. On the west side of the main building there is a shorter rectangular metal building with a flat roof and parapet. This building has a freight bay and metal roll-up door on the northwest corner. On its west side there are three building-height cylindrical metal vents which are attached to both the building and concrete pads on the ground **(Photograph 3)**.

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This building is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

DEPARTMENT OF PARKS AND RECREATION **HRI#**
CONTINUATION SHEET **Trinomial**

Page 4 **of** 5 ***Resource Name or #** (Assigned by recorder) Building 584

***Recorded by:** R. Herbert and K. Clementi **Date:** October 8, 2009 ☒ **Continuation** ☐ **Update**

Construction began on Building 584 in1975 and it went online in 1977. The plant had a boiler, an air compressor plant, a fuel oil storage facility and an intermediate industrial waste handling facility as well as utility lines. This plant replaced the mobile power systems of Mobile Utilities Support Equipment (MUSE) which provided "cold iron" power to the ships docked at Piers 2 and 3.[2] Cold iron is the term used to refer to a ship when it docks and powers down its engines, then plugs into port-provided-power which continues to run all of their on-board equipment such as refrigeration, cooling, heating, and lighting. Building 584 provided this power to the ships which docked at Piers 2 and 3. The plant remains much the same as when first constructed with the exception of a small addition added onto the northwest corner in 1994.

Evaluation

The pier utility boiler plant, Building 584, was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the public works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This prefabricated building is typical of Cold War-era buildings located on military bases. This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 584 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

***P3a. Description (cont.):**

The walkway leading up to the west side of the building is covered by a metal-framed awning supported by metal poles and framed on either side by knee-high brick planters **(Photograph 1)**. The entrance has double metal glazed doors with full-length fixed side lights. Other windows around the west, north and south sides are tall narrow anodized fixed windows with small hopper windows on the top and bottom. The corners of the building have setbacks with solid metal personnel doors. On the southeast corner of the building there is a small square one-story flat-roofed concrete room **(Photograph 2)**. The east side of the building, which is partially obscured by a tall fence enclosing a side yard, has a tile shed roof and an uneven façade with several entryways that have solid metal doors which open out onto a large concrete patio area next to what appears to be a flat-roofed storage room with a large metal storage container attached to it's north side **(Photograph 3)**. On the northeast side of the building the setback on the corner is partially enclosed by a concrete wall and has a small patio area with a set of solid metal doors and next to a window which was described above. Along the northwest side of the building there is a recessed solid metal personnel door at the top of shallow concrete steps with a low concrete metal utility box covered by a metal grate to the west of the door.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. [1] Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. Building 585 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 585 was constructed in 1976 as a new Chief Petty Officer club at a cost of approximately $829,000, replacing the previous CPO club that had been located off station near the southeast corner of the base near the corner of Lincoln Avenue and Central Avenue. The CPO Open Mess was constructed on the site where Building 84, Bachelor Officers' Quarters once stood. It included two bars, a restaurant, and stage with a dance floor. It could

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, California Historic Military Buildings and Structures Inventory (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

accommodate up to 450 people. Activities at this facility included live music, dancing, banquets, and bingo. It served as CPO Open Mess as well as a night club known as the "Top 4 Club."[2]

Evaluation

Building 585 was built during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building retains some integrity to when it was built, but is unremarkable in its use within routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for buildings constructed during the 1980s at naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while the CPO Open Mess served a valuable function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Building 585 does not possess historic significance and is not a contributing element of the NAS Alameda Historic District.

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

This semi-permanent building was constructed in 1976 to serve as a liquid oxygen equipment shelter. This building stored liquid oxygen for use in small aircraft.[2] It was most recently used as a Covered Ground Check-Flight Test maintenance shop.[3] Building 595 appears unaltered from its original construction.

Evaluation

Building 595 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] In the larger context of the naval operations in California and nationwide during this period, the storage function of these building

did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although it retains a measure of integrity from when it was constructed, it is unremarkable in its use in routine fleet support and not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda building is utilitarian in design, materials, and construction methodology and relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). The building is typical of Cold War era storage facilities located on military bases. The building does not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 540 is not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The irregular-shaped plan of Building 607 covers a total of 9,795 square feet. Built on a concrete foundation the vertical corrugated metal walls rise up to meet the corrugated metal hipped roof, which is accented with flashing. A combination of metal and glazed personnel doors provides access to all but the east side of the building, which lacks fenestration. The double metal personnel door on the northwest corner has a smaller set of metal doors directly above it. Rows of single-pane, casement windows are located along the north and south sides of the building and fixed side and overhead transom windows surround the glazed personnel doors. Large metal louver vents are located in the northeast and northwest sides of the building. The southwest corner of the building contains a ventilator structure that is enclosed by a tall, corrugated metal fence. The north end of the building has a small courtyard enclosed by a wooden fence.

This form has been prepared to reaffirm the City's previous conclusion based on the station wide evaluation of Cold War-era resources prepared as part of the study referenced in P11. Building 607 was previously evaluated in June 2009 as part of an Alameda Reuse and Redevelopment Authority (ARRA) / City of Alameda project to support an Alameda Point Collaborative Project. The ARRA concluded that the building did not meet the criteria for listing in the National Register and the SHPO concurred on July 8, 2009. For reference, the ARRA's previous form is attached. Building 607 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria. (See Continuation Sheet)

B10. Significance:

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 607 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

The new Craft Hobby Shop building was completed in 1980 at a cost of $1,130,000. A Hobby shop existed on NAS Alameda since the 1940s and served as recreation building that included wood, ceramics, and lapidary shops. Its grand opening in Building 607 took place on August 19, 1980. This new building also included a metal art room, resale store, multipurpose room, and textile classroom. During the 1980s, services in the Craft Hobby Shop included classes for the various shops as well as classes in cake decorating. Building 607 continued to serve as the Craft Hobby Shop until the base closure in 1997. No apparent external modifications were made to Building 607; however it may have been re-roofed between 1988 and 2000.[1]

Evaluation

Building 607 was built during the final decade of the Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building retains some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for buildings constructed during the 1980s at naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while this building served a beneficial MWR function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

The building is located at 677 West Ranger Street, Alameda California on the former Naval Air Station Alameda.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Building at 677 West Ranger is a metal clad, single story building with a standing metal seam roof constructed in 1980. The Building is located within the NAS Alameda Historic District, but it is not a designated contributer to the distict. The current occupant of the building, the Alameda Point Collaborative (APC) is proposing to modify the building to include a community kitchen. The building currently serves as an office and community center for APC. The modifications to the building are primarily within the building. Exterior changes to the building are limited to the southeast corner of the building which will be modified to allow for installation of a new walk-in cooler/freezer. The cooler/freezer will be located under the existing roofline and will be painted to match the existing metal siding of on the building. The existing roofline will not be modified. The exterior of the freezer unit is a galvanized metal produced by USS, called Galvalume. Galvalume is carbon steel sheet coated with aluminum zinc alloy. The exterior is easily primed and painted and will be painted to match the existing metal siding on the building.

B9a. Architect: Unknown b. Builder:
***B10. Significance: Theme:** n/a **Area:**
Period of Significance: n/a **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

World War II Evaluation:
The Alameda NAS Historic District is eligible for listing on the National Register with a period of significance from 1938 to 1945. Building 607 is located within the Shops Area of the NAS Historic District, but it is not a designated contributor to the NAS Historic District. The building was constructed in 1980 as a craft and hobby shop for families living on the base at the time. The building housed a ceramics shop and kilns, woodworking facilities, and other hobby materials.

The Shops Area of the NAS Historic District is described in the "Guide to Preserving the Character of the Naval Air Station Alameda Historic District" as the area that "was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail." The shop buildings were "designed strictly for function rather than appearance." Within the shops area there is no uniformity of design. The Guide concludes "notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8." The 1992 Sally Woodbridge study entitled "Historic Architectural Resources Inventory for the Naval Air Station, Alameda (1992)" determined that the building did not qualify as a contributor and the 2005 Page and Turnbull Historic District Assessment rated its significance as "low".

In conclusion, the minor modification to the exterior corner of Building 607 will not have a negative effect on the integrity of the NAS Historic District because Building 607 is not a contributor to the District, Building 607 does not display any of the character defining features characteristic of the Shops Area, the building was not built during the period of significance, and the modifications are designed such that the changes will only be visible from a limited view within the district, and the modifications are designed to minimize the changes to the appearance to the building.

Cold War Evaluation
A Cold War-era eligibility study has not yet been started for all buildings at the base, but records provide a basis for evaluating the structure. Built as a hobby shop for Navy personnel and families, the building does not appear to meet the criteria for listing in the National Register of Historic Places nor does the building embody the "exceptional importance" required under Criterion Consideration G for properties less than fifty years of age. There is no evidence that the building had direct or indirect important association with significant events and themes of the Cold War such as weapons or aircraft research and development or any associations with significant people (Criterion A and B). A structure with contemporary style and standardized form, Building 607 does not reflect important architectural themes or styles (Criterion C) or the potential to yield important information in the future (Criterion D). In conclusion, the utilitarian structure lacks architectural significance and does not appear to meet the criteria for listing on the National Register.

(This space reserved for official comments.)

Archeological Evaluation
The site is located on fill material placed between 1931 and 1935 by the US Army for the construction of Benton Air Field. The proposed modification would not result in any changes to the foundation or subsurface materials. Given that the site is on fill material and that the work is limited to minor exterior modifications to the building there is little

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 610 was constructed in 1979 and improved three years later, serving as a metal grinding and machining facility supporting the O & R functions of Building 360. It has maintained its location on the southern side of Building 360 since its construction and remained the high speed grind shelter until base closure in 1997. No apparent modifications have been made to Building 610.[2]

Evaluation

The high speed grind shelter, Building 610, was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the public works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is utilitarian in design, materials, and construction methodology and is

relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). Prefabricated buildings of this type are typical of Cold War era buildings located on military bases. This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while Building 610 served a valuable function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

The former Electronics Maintenance Shop (Building 611) is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 611 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Construction Battalion Unit-416 (Seabees) started construction on Building 611 in 1980 as an electronic repair facility.[2] This semi-permanent structure remained as an electronics maintenance shop until base closure in 1997. Aside from boarded-up windows, the building has no apparent modifications from its original construction.

Evaluation

Building 611 was built during the Cold War era operations on NAS Alameda, and is part of the broader fleet support functions of the station during this period. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building was

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
Building 612 is located in the southern portion of the naval base, east of Viking Street and south of W. Ticonderoga Avenue. This 4,000 square-foot utilitarian building sits on a concrete foundation with a west-east orientation. It has a low-sloped, front-gable roof of corrugated metal. The walls are clad in vertical corrugated metal siding and have metal corner boards. A low-sloped concrete ramp provides access to the single-story roll-up door on the west side. The west side also had a metal personnel door with a small glazed panel, two double hung, metal-framed windows with large metal louver vents above them. Both the north and south sides have rows of double-hung, metal framed windows and metal personnel doors.

B10. Significance (cont.):

Historic Context

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

This Andersen manufactured building was constructed in 1980 as the hose maintenance building. It was used to test and store flexible hoses and piping and incorporated a water recycling system.[2] The building maintained its location and use through base closure in 1997. The building has no apparent modifications since its original construction.

Evaluation

The hose maintenance building, Building 612, was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Public Works function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is

Building 613 is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 613 did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Construction of Building 613 was completed in 1983 at a cost of $300,000, to become the new location of the Family Services Center. The Family Services Center was developed in 1981 on NAS Alameda to assist Navy personnel and their families with relocation information, child development services, counseling, and volunteer work. It was originally located in Building 135 and moved to Building 137 in spring 1982. A delay in the phone-line systems prevented the Center from moving to its permanent location in Building 613 until 1983. By 1983 the Center was staffed and in full operation, offering crisis intervention and counseling along with workshops and support groups. Building records indicate that the building was modified in 1988; however the manner of alteration was not disclosed and no apparent changes are noticeable from the exterior. Building 613 remained the Family Services Center until base closure in 1997. [1]

Evaluation

Building 613 was built during the final years of the Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare,

strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The building retains some integrity to when it was built, but is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for buildings constructed during the 1980s at naval stations (NRHP Criterion C / CRHR Criterion 3). This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while the Family Services Center served a valuable function on NAS Alameda during the Cold War era, its construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Building 620 was constructed between 1980 and 1985, and covers about 3,600 square feet. It is a single story and has an irregular rectangular footprint with a composition shingled side-gable roof with open eaves and small metal vents in each gable close to the roof line. The building is clad in T-111 type siding. On the east side there is a solid personnel door covered by a shed roof extension and windows that have been boarded **(Photograph 1)**. On the north side is a larger equipment opening with a wooden tilt-up door. There are three additions on the north end, two have a side gabled roofs and wood paneling and two personnel entrances which are boarded over. The third addition sits on concrete pilings and has a flat top and vertical grooved wood panel siding with a boarded over personnel door **(Photograph 2)**.

B10. Significance (cont.):

Historic Context

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. Building 620 did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 620 is a late Cold War addition to the NAS Alameda facility and was used as an industrial shop. The space currently occupied by this building was used for aircraft parking from 1947 through 1970.[2] From 1970 until the construction of Building 620 it was used as an equipment and materials storage yard.[3]

Evaluation

Building 620 was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time as storage. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] In the larger

B10. Significance (cont.):

Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings and structures constructed during the Cold War era, or World War II-era buildings and structures used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. Building 621, constructed in 1988 for use as an industrial machine shop to support marine maintenance, was just such a building. Prior to the construction of Building 621, this portion of the base was initially used for aircraft parking between 1947 and 1970 and through the 1970s and 1980s the area was an equipment and materials storage yard. Building 621 does not appear to be modified from its original construction and remains in its original location. Nevertheless, it did not have a direct or important role in NAS Alameda's operations, ,nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era. Today, it is a ship services support building. [1]

Many building and structures on NAS Alameda, such as Building 621, fall within the "Waterfront Operations" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include piers, wharfs, dolphins, diving lockers, maintenance shops, crane tracks, and navigation range lights. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. These buildings are utilitarian and many are of prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, these buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

Evaluation

Building 621 was built in the midst of Cold War operations on NAS Alameda, and was part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Waterfront Operations function of the building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Building 621, moreover, while retaining integrity to the period when it was constructed was nevertheless unremarkable in its use in routine fleet support, and was not historically important, within the context of

Building 622 is located west of the Seaplane Lagoon and south of Building 25. It is a corrugated metal shed with a rectangular plan spanning 9,088 square feet. It has a very low-pitched, front-gable roof with a narrow overhang on the east and west sides. Its prefabricated metal walls rest on a raised concrete pad foundation. The south-facing façade includes two concrete steps that lead to a set of metal and glazed personnel doors, flanked by large louvered vents. Louvers comprise the majority of the north side of the building.

This steam boiler plant (Building 622) is not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because it does not possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. (See Continuation Sheet)

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique to NAS Alameda or the military and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Building 622 was constructed in 1987 as a steam generation building. It provided hot water and worked as a switching station for surrounding buildings. Its utilitarian purpose included use of a boiler and associated storage tanks located within the building.[2] Building 622 remains in its original location and does not appear to be modified since its original construction.

Evaluation

The steam boiler plant, Building 622, was constructed during Cold War operations on NAS Alameda, as a part of the infrastructure serving the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Building 622 is needed to support urban activities, and its ubiquitous nature renders it secondary in the context of station operations. While it retains some integrity to its original construction, it was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common

for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This prefabricated building is typical of Cold War era buildings located on military bases. This facility does not have a direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Building 622 was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

On former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 623 is a rectangular building with associated exhaust towers and tanks. It has concrete block walls built upon a concrete foundation; the concrete walls stop halfway up the building and are continued by corrugated metal walls that extend to the flat roof. It has three sets of double metal personnel doors on the south façade, which are interspersed with large metal vents. The east and west side lack any fenestration, but have adjacent metal exhaust towers. The north side area is enclosed by a chain link fence that restricts access to the associated large metal storage tanks and pipes. A concrete stoop leads to the single metal personnel door on the east end of the north side, next to an exterior metal service stairwell. Two large vents are also located on the north side of the building.

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. This building is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The building did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

Building 623 was constructed in 1987 as a support facility for Building 25. It stored bulk liquid jet engine fuel and was known as the diesel fuel tank farm until base closure in 1997. The building has numerous pipes and storage tanks that are externally linked to the building. The building and the associated equipment does not seem altered since its original construction.[2]

Evaluation

The fuel tank farm building was constructed during Cold War operations on NAS Alameda, and is part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the Public Works / Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it retains some integrity to its original construction, the building was unremarkable in its use in routine fleet support and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is

***P3a. Description (cont.):**

The top of the pier has a raised walkway edge. Along the south side of the pier there are a number of steel and cast iron dock cleats and bollards which are set on the inside of this walkway. The north side walkway is lined with modern steel streetlight poles. The north and south edges of the pier are lined with wooden pier bumpers. On the north side towards the east end there is a wooden personnel ramp leading to a floating dock in the Seaplane Lagoon. A ramp leads from the west end to the rock jetty (Building 200650, recorded on a separate form) that extends from the end of the pier; the jetty partially encloses the lagoon. Although there are no railroad tracks currently on the pier, track remnants can be found at the eastern base of the pier. Two floating camels are located near the center of the pier on it north side. There are several structures on the pier – most notably Building 617A, a temporary structure of unknown date – that appear to have been added after the original construction (**Photograph 3**).

Building 601, located at the foot of Pier 1, has a rectangular footprint and is approximately 1,000 square feet. It is a prefabricated Butler-style metal-clad building on a concrete pad with a low side gabled metal roof. On the south side of the building, there is a set of building-height solid-metal doors next to a single metal personnel door with a shed overhang; on the east side, there is a ground level knee-high metal vent and an equipment door (**Photograph 4**).

Pier 2 is 1,201 feet in length and extends from the shore east to west. It has a concrete deck set on steel "I" beams and is supported by concrete piles. Along either edge of the deck are alternating steel and cast iron dock cleats and bollards interrupting a concrete curb. The outer edge of the pier is lined with wooden pier bumpers. The top deck of the pier has a row of modern high intensity steel light poles which run down just off the center. There are abandoned crane tracks which run west to east and were used for a mobile crane and Mobile Utility Service Equipment (MUSE) units prior to 1977. These crane tracks, which also run along Pier 3, are Building 201062.

Along either edge of Pier 2 are utility boxes which provide different types of "cold iron" power to ships berthed at the pier (**Photographs 5, 6**). There are openings in the deck of Pier 2 that have been made in preparation to move electrical transformers below deck level to provide more space on the pier (**Photograph 7**).

Building 434 are two mooring vessels located at the western end of Pier 2. The smaller dolphin is a conventional dolphin consisting of a cluster of piles lashed together with rope with a ladder on the east side. The other vessel is a mooring platform with a concrete cap with a metal bollard at each corner on groups of piles. A light pole with beacon is located on the deck of the mooring platform (**Photograph 8**).

Pier 3 is approximately 1,365 feet long, 150 feet wide and extends from the shore east to west. It has a concrete deck set on steel "I" beams and is supported by concrete piles. Along the edge of the deck are alternating steel and cast iron dock cleats and bollards interrupting a concrete curb. The outer edge of the pier is lined with wooden pier bumpers. The top deck of the pier is divided lengthwise by a four foot chain link fence. There is a row of modern high intensity steel light poles which run down the center of the pier. Each side of the pier has an abandoned crane track (Building 201062) set in it along with widely spaced track for a mobile crane (**Photographs 9, 10**). An angled connecting railroad track is located toward the west end of the pier. At the west end of the pier there is a metal transformer box labeled "104"; west of the transformer box is a metal shed roof building set out from the end of the pier on wooden pilings. On the north side of Pier 3, near the USS *Hornet* Museum, is a plaque commemorating the Doolittle Raid of April 18, 1942. The plaque was erected by the Native Sons of the Golden West on December 7, 2007.

Building 431 is a dolphin located at the western end of Pier 3. I t is a conventional dolphin consisting of a cluster of piles lashed together with rope. A ladder is located on the east side and two red-light beacons on top of the dolphin (**Photograph 11**).

Wharf 1, located between Piers 1 and 2 south of the Seaplane Lagoon, has a northeast/southwest orientation with an area totaling 7,586 square feet. It is a concrete surface on concrete piles and a west facing edge interspersed with five cleats and five metal bollards. At its longest point, it is 775 feet and at its widest 50 feet. A metal ladder near the north end of the wharf leads down to the water level. A board formed concrete wall in front of the wall piers has a horizontal wooden bar and located between the wooden piers and concrete are pipes for utility hookups (**Photograph 12**).

Wharf 2, located between Piers 2 and 3 south of the Seaplane Lagoon, measures 582 long by 45 feet wide with a concrete surface and concrete curbing with interspersed with three metal cleats, four metal bollards, and lighting. A metal ladder near the south end of the wharf leads down to the water level. Like Wharf 1, Wharf 2 has a board formed concrete wall in front of the wall piers with a horizontal wooden bar and located between the wooden piers and concrete are pipes for utility hookups (**Photograph 13**).

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Experiments in Naval aviation began as early as 1910 when the first biplane took off from the deck of the cruiser *USS Birmingham* (CL-2). Maneuvers in 1913 illustrated the first uses of Navy aircraft for observation, spotting and reconnaissance. During this exercise off the coast of Cuba, the entire Naval aviation contingent participated in scouting, spotting mines and submarines. Despite the growing usefulness of naval aviation, further illustrated through the use of seaplanes for anti-submarine patrols in World War I, the sinking of the *Ostfriesland* by aircraft, and successful employment of aircraft in the 1923 Fleet Exercises, funding to expand Naval aviation activities was slow in coming.[1] The advent of Naval aviation resulted in the creation of new classes of ships to tend to aircraft, among these were seaplane tenders and aircraft carriers. Together ships and planes extended their individual tactical capabilities and operational range. Naval air stations, like NAS Alameda, were equipped with airfields and docking facilities to accommodate both craft. During World War II the combined abilities of aircraft and ships became critical in the Pacific theater. The piers and wharfs of NAS Alameda provided docking for carriers and seaplane tenders and support for these ships. The pier and wharf system provided means of supplying the ships, unloading and off loading aircraft, and supporting ship systems while in dock. Pier 2 is the likely embarkation point for the Doolittle Raid of

Webster, United States Army Construction Engineering Research Laboratory, "Historical and Architectural Overview of Military Aircraft Hangars," Prepared for United States Air Force Headquarters, Air Combat Command, 1999 revised 2001, 1-9 – 1-10, 2-13, 3-24 – 3-41, http://www.cecer.army.mil/TechReports/webster98/webster98_idx.htm (accessed September 15, 2009); Kirby Harrison, "U.S. Naval Aviation 75 Years of Pride and Tradition," *Naval Aviation* (May-June 1986): 4, www.history.navy.mil/nan/backissues/1980s/1986/mj86.pdf (accessed January 10, 2009); *Chronology of Significant Events in Naval Aviation, 1910-1915* (Washington, DC: Naval Aviation History Office, 1997) 4, 11.

April 18, 1942 against Japan, but the area has been heavily altered through improvements to the piers and ship services at the piers.

Pier 1 was built by the San Francisco Bridge Company in 1939; it was intended to be used by tenders, smaller boats and ships that serviced larger vessels. As built, the pier was concrete on concrete pilings and consisted "of 24 cells of steel sheet piling filled with dredged material and surfaced with Penetration Macadam with a concrete cap and curb along outside walls, also a pile fender system." A standard gauge track railway facility was included on the structure. Between the 1939 construction date and the 1980s, Pier 1 was repaired and upgraded numerous times.[2]

Constructed in 1980 at the western end of Pier 1, the Butler-style Building 601 served as an oil/water separator facility, treating and discharging bilge water (water that contains oil, solvents and other environmentally hazardous material) produced aboard ships. Butler-style buildings – commonly referred to as "Butlers," from the name of the leading manufacturer of such buildings, the Butler Manufacturing Company – were designed with prefabricated rigid, wedge beam, steel frames. Gable roofed and sided with seamed or corrugated sheet metal, "Butlers" were used extensively by the military after World War II. Unlike the arch-shaped Quonset huts used extensively during World War II and the Korean War, Butler buildings often had interchangeable parts and could be combined in various fashions. They had "truss clear" or "clear span" interior spaces that provided more room and were liked for their ease and speed with which personnel could construct them. They were also far more resistant to fire than the many temporary wood buildings constructed by the military during World War II.[3]

Pier 2 was built in 1941, and along with Pier 3, berthed and serviced a variety of aircraft carriers through the 1990s. As it built, the pier (like Pier 1) had a standard gauge 30-foot crane tracks which ran from east to west. In 1973, Pier 2 was extensively modernized by Santa Fe Pomeroy, Inc. of San Francisco (a sub-contractor to Scott-Buttner Corporation of Oakland). Alterations to the structure included extending the pier 200 feet in length to accommodate larger vessels, installing a sewer to receive sanitary waste discharge of berthed ships, and upgrading the pier's utility system. In the interim, to supply power to Pier 2, a 26,000 pound per hour (PPH) MUSE boiler was installed along with a new 12 KV line, and temporary steam, potable water, and compressed air lines. The 12 KV line ran from south to north across the pier and provided cold iron power – power supplied by ports to berth vessels to permit vessel to continue operating onboard equipment such as refrigeration, cooling, heating, and lighting. These changes also necessitated moving the MUSE Transformer located at from Pier 3 (installed in 1971) to Pier 2.[4] Today, Pier 2 is presently undergoing construction to move electrical transformers below its deck. The pier continues to berth many types of large seagoing vessels.

These crane tracks, which also run along Pier 3, are Building 201062. The tracks were originally constructed in 1940 to service Pier 2; they were extended to Pier 3 when it was built in 1945. The Colby Porter Crane, which ran along

the tracks in the 1960s and assisted in loading and off-loading vessels, was operated out of Building 292 (recorded on a separate form). In late 1967, the engine of this crane was replaced.[5]

Building 434, located west of Pier 434, was constructed in 1945 and consists of two fixed mooring vessels. The smaller mooring vessel is a dolphin used as a guide and buffer to prevent damage from collisions between ships and water front structures. The second is a square mooring platform, which was constructed between 1987 and 1988.[6]
Pier 3 was built in 1945 by Ben C. Garwich, Inc. of San Francisco. It was designed to berth aircraft carriers and also had a standard gauge 30-foot crane railway facility which ran from east to west. Since 1945, Pier 3 berthed many of the same aircraft carriers as Pier 2 – *USS Hornet* (CV-8), *USS Midway* (CV-41), *USS Coral Sea* (CV-43), *USS Nimitz* (CVN-68), including the first nuclear powered carrier the *USS Enterprise* (CVN-65). Pier 3 also provided service to deep draft ships assigned to the Bay Area.[7]

Although a monument is posted at Pier 3 commemorating the Doolittle Raid of April 18, 1942, the raid was likely launched from either Pier 1 or Pier 2 as Pier 3 was not constructed until 1945. In addition, no facilities on NAS Alameda were built specifically in support of this well-known mission. In March 1942, the mission led by USAAF Lt. Col. James "Jimmy" Doolittle against Japan departed for combat from Alameda. Sixteen Army Air Corps B-25 Mitchell bombers were loaded aboard the carrier *USS Hornet* under strict secrecy at the naval station's Pier 1 or 2, and on April 2 departed for the Sea of Japan. A little over two weeks later, on April 18, 1942, Doolittle's Raiders attacked Tokyo, Nagoya, Osaka, and Kobe, scoring a symbolic, psychological, and by some interpretations, a strategic victory against the Japanese early in the war.[8]

As the need for pierage grew on the west coast, beginning in the 1950s, some additions and alterations were made to the piers. In 1951, two dolphins – groups of pilings that provide extra space at piers to moor ships and to act a buffer, preventing damage from collisions between ships and water front structures – were constructed; one of these dolphins was Building 431, located west of Pier 3. Seven years later, a party fishing boat and a new recreation boathouse were sited at the foot of Pier 3. In 1971, still more improvements were made to the pier area; mooring camels, floats set up to moor vessels in addition to the piers, were set up to improve fleet services.[9]

One of the most significant upgrades to Pier 3 was the MUSE installation in 1971 to meet the cold iron power needs of the USS *Midway*. The MUSE was diesel-electric powered; it had a 1500 KW generator with a separate control unit and two 750 KW generators mounted on the rail section located midpoint on the north side of the pier. The power was delivered to the ship's main sponson (connection point) and the aft emergency bus (electrical connection). MUSE was originally installed on the crane tracks, which gave the Navy the option to move the transformer readily from pier to pier as needed (as it did when Pier 2 was undergoing renovation). Cold iron power was previously

provided to the USS *Enterprise* by the City of Alameda, which could only support cold iron power to one ship at the time.[10]

In 1977, the continuing demand for power to the pier was resolved when the Pier Utilities Boiler Plant (Building 584) was built and went online (recorded on a separate form). This was a permanent power plant on the base which could support cold iron power requirements to ships at both Piers 2 and 3, and replaced the MUSE system of cold iron power. The ability to berth the *Nimitz*-class aircraft carriers at Pier 3 enabled Alameda to become one of two naval air stations on the West Coast to support all phases of carrier aviation.[11] In 1981 as the aircraft carriers increased in size and the demand for cold iron power grew, Pier 3 electrical systems were upgraded to provide a *Nimitz*-class vessel – among the largest aircraft carriers ever built at 1,040 feet in length – to shut down its nuclear reactors and use land-based energy. This upgrade was completed in June 1983 and allowed Pier 3 to provide power both the supercarrier *Enterprise* and a *Nimitz*-class carrier.[12]

Wharf 1 was originally constructed as a bulkhead by Macco Construction of Los Angeles in 1939. The Wharf, also known as the Approach Pier, was constructed by Johnson, Drake and Piper and the later extension of 24 feet and increased width of ten feet was completed by contractors Ben C. Gerwick of San Francisco.[13]

Wharf 2 was constructed in 1945 by Ben C. Gerwick Incorporated of San Francisco. In 1990 the concrete surface of the wharf was replaced, which included the removal of railroad tracks, due to damage from the 1989 earthquake.[14]

The structures grouped together in this form represent a period of time at NAS Alameda from 1939 through 1990 and reflect the increasing demand of waterfront operations of a growing, active naval base through the addition of infrastructure. Although constructed at different times, Carrier Piers 1, 2, and 3; Wharfs 1 and 2; and Buildings 431 and 434 share similarities in design and construction to each other. Despite not having a counterpart in the vicinity, the design and construction of Building 601 was virtually identical to any other Butler-style building of the Cold War era; similarly, the crane tracks were of standard gauge and appear to be of common design.

Evaluation

Carrier Piers 1 through 3, Wharfs 1 and 2, and Building 434 (mooring dolphin) were built as part of the original period of construction on the station, and fall within the period of significance of the district: 1938-1945. Although these structures are associated with the district's significance under NRHP Criterion A (CRHR Criterion 1) for its contribution to the nation's defense during World War II, the alterations to piers and the surrounding area prevent them from conveying its association with the World War II context. Furthermore, the piers and wharfs lack individual integrity and the utilitarian style prevents these structures from conveying any architectural design significance it may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[15]

The buildings considered to be non-contributors were those within the district that were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. The carrier piers area was placed in the latter category because the buildings and structures were so altered through multiple changes over time that they do not contribute to the district. Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the buildings were originally constructed during the period of significance, many structural changes have been made since that time. Pier 1 has been repaired and upgraded during its lifetime. Pier 2 retains little integrity to its potential period of significance through numerous renovations and the addition of temporary structures has substantially altered the pier. Pier 3 was upgraded in the 1970s with the addition of MUSE / cold iron equipment. Wharf 2 was resurfaced and the railroad tracks removed in the early 1990s, which has altered its integrity. Overall the alterations have degraded the integrity of design, materials, feeling and association. Significant post –World War II construction of other buildings in the area have impacted the integrity of setting, feeling and association. The carrier piers area, therefore, does not convey its association with NAS Alameda operations during World War II, and is not a contributing element of the historic district.

The carrier pier area falls within the "Waterfront Operations" property type. Following the advent of aircraft carrier operations during World War II strategy and tactical emphasis within the Navy shifted to other areas. The "Historic Context: Themes, Property Types, and Registration Requirements" for California Military Properties (the Statewide Study) does not include Naval air stations as significant within the Cold War context. During the Cold War waterfront operations became common support activities. These properties were not directly related to the primary mission of the station, but were developed and utilized as necessary elements of a functioning naval facility. The ordinary functions of this property type during the Cold War are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. These buildings are utilitarian and many are of prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, theses buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.

In the larger context of the naval operations in California and nationwide during the Cold War, the Waterfront Operations function of this area did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations during the Cold War. The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and

[15] Sally B. Woodbridge, "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," (1992), 1-2, 11-12.

evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[16] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

These children's play yards, Buildings FH-2127 and FH-2129, are not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These structures are not eligible for listing in the NRHP or CRHR because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. The structures did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did they make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

During the mid to late 1960s, as part of the Navy's build up of housing in the Capehart neighborhoods, they also encouraged the inclusion of family friendly amenities like playgrounds. Site surveys have documented the existence of recreational facilities such as children's playgrounds as well as ball fields.[1]

Evaluation

These resources were built during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the MWR function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). The construction and use of the children's play yards was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Additionally, the replacement of all play equipment has diminished the overall integrity of the structures, as those are the key elements of a play yard.

Building 410 is a rectangular single story, metal clad, double gabled metal roof building. It is approximately 34,668 square feet. Three large metal vents and other smaller vents pierce each of the two rooflines. The west side of the building has a set of large retractable multi-pocket metal doors which, when closed, meet at a stationary metal panel with a solid metal personnel door that is close to the center of the building. There are five pocket doors on the south end with an inset solid metal door and ground level waist-high louvered vents in the bottom of the other four pocket doors. (See Continuation Sheet.)

***P3a. Description (cont.):**

The north end of the west side has a set of six pocket doors – five with vents and one with a solid metal personnel door. When put in motion, the pocket doors would roll back into the large metal pocket which extends from either the north or south ends. Each of the pockets has a solid metal door on the north and south side. When the doors are closed, the west side of the building appears to have a concave façade with a cantilever overhang **(Photograph 1 and 3)**.

The north side of the building has several multi-level shed additions. The lower addition is enclosed with metal siding and has three ribbons of two-by-two metal framed awning windows on the north side with a metal personal door that has louvered vents. The higher shed addition has only a shed roof supported by metal "I" beams and is surrounded by a chain link fence **(Photograph 1)**.

The east side, or the back of the building, has two identical sections under each gable. Each side has a solid metal personnel door, a mid-height shed extension and a roll-up bay door. It appears that the south side of the building has been altered in the past and then changed back by reapplying individual sheets of corrugated metal **(Photograph 2)**.

Building 351 is a Quonset Hut, a lightweight prefabricated building made out of corrugated galvanized steel setting on mudsill. A single metal personnel door and boarded over window are located on the east and west sides **(Photograph 4)**.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This group of buildings is not eligible for listing in the NRHP or CRHR because neither individually nor as a group do they possess historic significance under the NRHP or CRHR criteria. Although Buildings 410 and 351 participated in NAS Alameda's Assembly & Repair (A&R, later Overhaul and Repair, or O&R, and Naval Aircraft Rework Facility, or NARF) operations, particularly with regard to aircraft preservation, these buildings were not engaged in historically significant naval missions and activities.[1]

Construction on Building 410 was complete on April 21, 1958 **(Photograph 6)**.[2] The building was built specifically for aircraft stripping, cleaning, and corrosion control activities which prepared the aircraft for eventual storage in nearby special containers (Buildings 338A-H, recorded on a separate form) – colloquially known as "cans" – for

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.
[2] "1960s Oblique Aerial," RG 181, 3195B-C, Box 21 of 22, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).

preservation of inactive aircraft. Building 410 stored and used chemicals and wastes including oils, paints, paint strippers, detergents, and waste water that were either critical to or byproducts of aircraft preservation.[3]

Building 351 was constructed by Station Forces in 1949 east of the aircraft parking near the piers, and used as for general maintenance by the Overhaul and Repair department **(Photograph 2)**. The building was moved around 1958 to the northwest corner of newly constructed Building 410 and acted as a support building to the aircraft stripping facility that held flammable materials **(Photograph 5)**. It served the stripping facility as a corrosion control facility until 1990.[4]

Thousands of Quonset huts were built in the United States starting in World War II. Their design was based on the Nissen Bow Hut first built by the British military during World War I. Named for their place of manufacture, the Davisville Construction Battalion Center at Quonset Point Naval Air Station, Rhode Island, several other companies became involved in manufacture of this building type including Stran Steel, the Anderson Sheet Metal Company and Armco International Corporation of Middletown, Ohio. Armco was the company that manufactured a heavy ingot iron building which was modeled on earth-retaining structures similar to storm sewers or culverts. Armco Huts were used for both ammunition magazines as well as personnel shelters. Armco Huts needed no rib supports and were strong enough to be buried under six feet of earth.[5]

Evaluation

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] Buildings 410 and 351, therefore, although possessing a relatively high degree of integrity nevertheless do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because neither has direct or important associations with significant events or trends of that era (NRHP Criterion A / CRHR Criterion 1) or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). These buildings, moreover, do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3) nor are they likely to reveal important

historical information about that period (NRHP Criterion D / CRHR Criterion 4). Buildings 410 and 351 played valuable roles in the operations of the station, particularly with regard to aircraft preservation, but that role was not historically significant to the research, design, testing and evaluation of such aircraft – functions that might have qualify the buildings for listing on National Register or the California Register.

This form is an update to the previous recordation of this building in "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992 by Sally B. Woodbridge (see attached). The re-evaluation contained herein concludes that Building 19 is eligible for listing in the NRHP as a contributing element of the NAS Alameda Historic District. Its NRHP status code is 3D.

P1. Other Identifier: Building 19

P2 e. Other Locational Data: 2175 Monarch Avenue on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 19, the Control Tower, is a 23,706 square foot, roughly L-shaped building constructed in a series of phases beginning in 1941. The main portion of the building is constructed of poured concrete. The foundation utilized board forms and larger panel forms were used for the remainder of the building. The north-south portion of the L is two stories and the east-west portion is a single story. A four-story control tower rises from the southwest corner of the building (**Photograph 1 and Photograph 2**). A wood frame segment extending east from the northern corner, recorded in 1990, has been removed.

The north-south element of the L-shape has a rectangular form with a parapet roof and is five bays long. There is a contemporary metal railing at the parapet and the roof has been covered with wood decking to create a useable exterior space. Some of the metal frame divided windows in this portion of the building appear to be replacement windows. Facing the airfield (west side) bands at each story connect groups of three light windows, except for the large pane replacement windows on the first floor and large vertical single pane window at the stairwell adjacent the western entrance. The bay closest to the tower, contains a flat hood sheltered entrance accessed by a short flight of steps. The entrance is a pair of contemporary aluminum frame glazed automatic sliding doors with wide side lights and a two part transom. The north side of the building has an exterior metal stair with tubular metal rails. At each level a metal personnel door leads to the stairs that is adjacent to a single three light north facing window. On the east side of the building there are four groupings of windows located on the southern half of the upper story overlooking the single-story east-west portion and the entrance located on the first floor. The northern most grouping of east facing windows on the second floor is smaller than the other sets of windows. Raised bands connect the windows and extend to the northern end where there are no openings, but there are repairs in the concrete where previous openings were in-filled. The first floor entrance on the east side is similar to the west side entrance. It is a pair of aluminum frame glazed automatic sliding doors with wide side lights and a two part transom sheltered by a flat hood and is reached by a set of concrete stairs. The entrance can also be accessed by a contemporary concrete wheelchair ramp that doubles back along the northern portion of the building (**Photographs 1, 2, 3, 4, 5, and 6**). The south side of this portion of the building, adjacent to the control tower, has two smaller sets of windows on the second floor.

The east-west portion of the building is formed by a single-story element on a high foundation and consists of two sections. The northern portion is nearly square and built of poured concrete. It has three groups of three light windows with the bottom light an operable hopper window. Raised bands are located above and below the windows and continue around to the east end of the building, which has another grouping of windows and a single personnel door. The door is sheltered by a square concrete hood and is reached by a set of poured concrete stairs with tubular metal rails. The door has a vertical rectangular window and transom. The southern portion of this part of the building extends further east and is constructed on a similar concrete foundation. This portion of the building was remodeled with stucco panels and it has contemporary metal frame windows with operable bottom hoppers. There is a single set of windows facing east, west, and north, the latter of which may have been reused from the earlier iteration of the wing. There are five sets of windows facing south (**Photographs 3, 4, 5, and 6**).
The control tower element of Building 19 is a square, four story tower rising from the southwest corner of the building. It is made of concrete and is topped by a control room. The concrete tower continues the bands of windows

pattern from the north-south element of Building 19 on the second floor and third floors. The bands consist of sets of windows with corner windows on the west side of the tower. The east side has two single windows on the third floor. Fenestration on the ground floor is comprised of single windows and a pair of west facing windows, along with entrances on the east and west sides of the tower. The metal door entrances, one on the east and two on the west, are accessed by concrete steps, the eastern of which also has a transom above the door. The control room is set on the flat roof of the control tower, recessed slightly from the plane of the exterior wall that is topped by a contemporary metal tube railing. The walls of the control room are largely comprised of glass with large panes angling out from the top and bottom. The glass windows form an octagon and are built on a concrete base and topped by a concrete roof supporting antennas. There is a glazed doorway with sidelights and transom facing northeast. The control room is reached on the exterior by a metal stair from the roof of the north-south element of the building and there are spiral stairs on the interior.

The interior areas of Building 19 have been altered throughout the building. The ground floor was renovated in the 1990s to accommodate new offices, thus changing the original interior plan. Additionally, the control tower itself, once the heart of operations, has had its equipment removed (**Photograph 7**).

There are also two other buildings associated with Building 19 that are noted here, but recorded on a separate DPR 523 form. These are Building 19-1 and Building 491. Building 19-1 was constructed in 1962 as an addition to Building 19 and was connected to the building. This metal side-gable garage is located immediately north of Building 19 and is now freestanding. Building 491 is located on the south side of Building 19 adjacent to the control tower and is a (freestanding) small one-story concrete block flat roof building constructed in 1961.

B10. Significance (cont.):

This update form was prepared to provide additional information about the Control Tower, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[1] Similar to efforts made by the Army, the Navy adopted this master planning approach to design in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings.[2] BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. Building 19, the operations building, was placed at the corner between the airfield and Seaplane Lagoon. The NAS Alameda base plan had a comprehensive aesthetic design based on Beaux Art axial planning, in addition to its functional organization. The most important aspect of these plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. BuDocks used these principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda in 1939 show that from the beginning, the station was arranged along intersecting axes, although placement of the Operations Building / Control Tower was not yet defined. This likely occurred with input from BuAer, following approval of the station's initial plans.[3]

Building 19 housed the Operations Department on NAS Alameda. The department coordinated airfield and dock operations, communicated with inbound and outbound aircraft, filed flight data, and operated transportation and ferry flights to the station. Within Building 19 three functions occurred: flight control, flight information and emergency rescue services. The remaining portion of Building 19 reflects the flight control aspect of the activities. Information services provided by the department included aerial and station photography needs in addition to monitoring flight information, and was partially located in the wooden wing on the northeast corner of the building (no longer extant).

The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

Rescue and crash services were contained in another wing on the northwest corner of the building (also no longer extant).[4]

Increasing use of radar and radio and the development of instrumented landings resulted in changes to the equipment in the control tower. The original lights and signal devices on the roof of the control tower, used to indicate airfield conditions, were replaced with antenna and other electronic signal equipment. An unusual feature was the installation of a closed circuit television system in 1956. Runway expansion to accommodate jet aircraft expanded beyond the visual range of the tower and the television system was installed to provide visual information.[5]

Among the tenant activities was the Navy Weather Central San Francisco. In 1950 Weather Central moved to the base from the Federal Office Building in San Francisco and occupied offices on the second floor of Building 19. In 1957 the Navy Weather Central San Francisco was renamed Fleet Weather Central (FWC) under the control of the Bureau of Aeronautics. This change in organization did not change the mission of FWC, which was to gather and report weather data to the military supporting flight and naval operations. Naval support included oceanographic information for surface ships and submarines and surface data used to plan safe and efficient oceanic journeys. Information was provided to all 12th Naval District activities and selected other agencies. This activity, like the control tower operations, updated equipment throughout its tenancy. Additional administrative reorganization in the 1970s replaced the FWC with the Naval Oceanography Command Detachment Alameda providing the same services.[6]

Like other buildings on NAS Alameda constructed during the World War II period, Building 19 was constructed in phases and has also had portions removed over time (**Figure 1**). Martinalli Construction Co. of San Francisco constructed the first portion of Building 19 in 1941 for $257,907 as part of the initial development of NAS Alameda. This initial building was an 'L' shaped one to two story building with the four story control tower at the southwest corner. The plan for the control tower, an octagonal room with angled windows, was typical of towers that the BuDocks designed and built at the time. During World War II, contractor Johnson, Drake and Piper built additional wings on the building.[7] In 1943 a two story, timber frame wood sided wing was added to the northeast corner of the

building, increasing the square footage by approximately one third. Between 1944 and 1945 two more wings were added to the building. These were an addition on the south side of the one story east-west wing of the original building and a garage off the northwest corner, both of which were timber frame structures with wood siding. The current southern portion of the east-west wing has the same footprint, and is of similar size, as the 1945 addition in that location. The concrete foundation appears to be original, but the single story structure on that foundation has stucco panels with more windows than the original 1945 addition. The garage at the northwest corner of the building no longer remains (**Photograph 8**).[8] Following 1945 the Navy made several alterations to the northern end of the building and also made interior alterations (**Table 1**). Woodbridge's previous recordation noted that the Navy made multiple alterations to this building, but she did not specifically list what those changes were or when they were made.

Photograph 8: 1945 picture of Building 19 with fire/rescue station on left.[9]

In 1956, the Navy added to the building's crash and rescue facilities with a metal car port on the east side of the garage that had been built in 1945 (and is not extant). A metal frame gable structure with metal siding, now known as 19-1, replaced that carport and more than doubled the capacity for crash and rescue in 1962 (**Photograph 9**).[10]

Internal modifications of rooms, halls, and mechanical equipment occurred throughout Building 19's history; however, no exterior modifications could be correlated with the years 1960, 1965, and 1967 that were noted on Woodbridge's previous evaluation of this building. At the time of Woodbridge's evaluation in the early 1990s the building retained its components built during World War II with the addition of expanded crash and rescue facilities. In 1989 the Loma Prieta earthquake struck the San Francisco Bay Area and caused major damage to NAS Alameda's airfield runways, taxiways and parking aprons as well as to some buildings, including Building 19. The wings on the northeast and northwest part of the building, constructed in 1945 had major damage and were removed in 1993 following Woodbridge's evaluation. As a result, the original core building from 1941 remains intact with a resided 1945 addition along the south side. Removal of the crash and rescue garage left Building 19-1 detached from Building 19.[11]

Since NAS Alameda's dis-establishment and Woodbridge's previous recordation in 1990 (see attached), Building 19 has been remodeled for use as offices and research space. Alterations to the building include replaced glazing, replacement exterior doors / windows, replacement of siding on south wing, and addition of a wheel chair ramp and the fire escape stairs. Doors and windows have been infilled, including a single personnel door and windows that were by the east side entrance, as well as an east facing window on the southern wing. The exterior stairs to the control tower were replaced and are now less steep than their historic predecessors, and additional railings were added atop the parapet. A small shed roof extension that had been built off the north side of the third floor the control tower was also removed. In addition, recent changes have exposed original windows. During the latter operational period of the station, west facing third floor windows on the control tower had been covered by a sign that read "Nimitz Field." This sign was subsequently removed revealing original windows.

Photograph 9: Building 19 during 1960s, camera facing southwest.[12]

Establishments, National Archives and Records Administration, Pacific Region, (San Francisco). [17] "Navy Using Television to Land Planes" *Oakland Tribune*, 26 February 1956.

Year	Alteration
1958*	Addition of car port to east of existing crash garage and dormitory infill.[18]
1960*	No exterior alteration identified
1961	Control tower glass improvement[19]
1962-1963	Additional crash and rescue garage (19-1) [20]
1965*	No exterior alteration identified.
1967*	No exterior alteration identified.
1992-1993	Northeast wing removed, original crash garage removed, leaving building 19-1
1990s-2000s	Window / door replacement and in-fill; south wing siding replaced; fire escape / wheel chair ramp added; control tower windows revealed; control tower exterior stairs replaced; parapet railing added; interior alterations.

*Woodbridge indicates exterior alterations these years.

Evaluation

Building 19 was previously recorded by Sally B. Woodbridge as a part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda" completed in 1992, in which it was considered a non-contributing element of the identified historic district. The Woodbridge evaluation concluded that the building had lost historic integrity. As discussed herein, re-evaluation of this building now concludes that it retains sufficient historic integrity to be a contributor to the historic district. The evaluation also concludes that Building 19 does not appear to have significance in terms of Cold War themes or events. Although it played a central role in the operations of this station during the Cold War era, its functions and uses were common to naval air stations around the nation and were not historically significant.

This evaluation concludes that Building 19's place within the existing NAS Alameda Historic District is as a contributing resource because of its shared association with other contributors to that district's significance under Criterion A and under Criterion C, as discussed below.

The original district significance discussion stated:

[18] United States Navy, Bureau of Yards & Docks; NAS Alameda, Building 19, " Additional Dormitory Space for Crash Fire Crew Building 19," PWO Drawing No. 8851, Aperture Card PWC 66058, 3/17/1959, BuDocks, BRAC PMO, West Caretaker Site Office, Treasure Island.

[19] United States Navy, Bureau of Yards & Docks; NAS Alameda, Building 19, "Replacement of Window Glass in Control Tower Cab. Building 19," PWO Drawing No. 9916, Aperture Card PWC 59900, 03 Aug 1961, BuDocks, BRAC PMO West Caretaker Site Office, Treasure Island.

[20] United States Navy, Bureau of Yards & Docks; NAS Alameda, Building 19, "Additional Crash Fire Facilities Proj, P-25," PWO Drawing Number 10433, Aperture Card PWC 57613, 6/19/1962, BuDocks, BRAC PMO West Caretaker Site Office, Treasure Island.

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and park like open spaces.

Buildings considered non-contributors were those within the district that were either constructed outside the period of significance (i.e., post 1945) or those built within the period of significance that had lost integrity through alteration. Building 19 had been placed in the second category because of what were considered "additions and alterations carried out after 1946." Woodbridge had limited access to Facilities Management Office files, and she summarized alterations to this building as "several wooden and metal-sided exterior additions in 1958, 1960, 1965, 1967; a wing on the S side and additions on the E side." Woodbridge may have considered some of the building's additions that had been constructed during World War II to have been among the changes built after 1946. Research undertaken for this project in building plans, contracts, and other sources, shows that most of the building extant in 1990 dated from the period of significance of the historic district (1938-1945) and most of the dates provided on the Woodbridge form do not correspond with major exterior alterations (**Table 1**). The building as it stands today includes the original tower and offices constructed in 1941, along with one wing that was built in 1945.

Building 19 is a contributor to the NAS Alameda Historic District, which is significant at the state level under NRHP Criterion A and NRHP Criterion C. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development during the period of significance 1938-1945. Building 19 was the central facility for aircraft operations on the station. The building has primary significance for its association with the historic district's importance in naval air station development and the role NAS Alameda served during World War II. In addition to its historical significance, Building 19 also retains sufficient historic integrity to convey its significance to the historic district's period of significance.

Under Criterion A, Building 19 is a contributor to the NAS Alameda Historic District because of its important role within the station as the control point for flight operations and its association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and its important associations with the station's role in Pacific theater naval operations during World War II. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. Building 19's crucial and primary function of aircraft flight control illustrates and provides a direct link to NAS Alameda support of its central and vital role in the Pacific theater. The building's expansion during the

war reflected additional functions. The building's secondary functions and the loss of building elements associated with these activities does not diminish the significance of the building, as its primary function of air traffic control and aircraft operations remains evident in the extant building.

Under Criterion C, Building 19 is significant for its distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts and organization following master planning principles that have been called "total base design." The design of NAS Alameda integrated a strong Beaux Arts style plan – that was fundamental to the station layout – with assiduous attention to the integration and organization of its various functions. NAS Alameda's careful arrangement of spatial organization and buildings / structures, along with the integration of architecture and landscape, use of Moderne style architecture, and details of the station's architecture demonstrate the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation. Design and construction of Building 19, as a flight control building, demonstrates the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period, and it shows the magnitude the Navy placed on the design to illustrate the modernity and importance of the naval aviation strategy for the Pacific Fleet. Refined details of the design, architectural details in keeping with the station theme, and functional location further support the importance placed on the design. Building 19 shares character-defining features (discussed further below) with the administrative core and shops on NAS Alameda. Completion of the station plan was sped up and successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers.

The building retains sufficient integrity of location, design, setting, materials, workmanship, feeling and association to contribute to the historic district and its period of significance from 1938-1945. Although there have been many alterations made to this building over time, including removal of building wings that had been constructed during the period of significance, the building retains essential physical features that convey its significance within the historic district. The building's form includes the original 1941 L-shape component plus an addition in 1945, thus illustrating the expansion of this facility, and leaving it recognizable to the district's period of significance. Wings that were added and removed to the building were constructed in a more temporary fashion and housed secondary functions, thus they were less important to the buildings historic integrity of design, materials, workmanship, feeling, and association. Many of the smaller alterations that have been made to the building have been done appropriately to retain the facilities overall integrity of design, materials, and workmanship on the exterior, generally leaving intact the building's historic massing, proportions, door / window patterns, and spatial relationships between its components. Furthermore, no additions have been built that obscure the historic building.

The historic district, and its contributors including Building 19, does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

Building 19 shares character-defining elements with both administrative and shop facilities throughout NAS Alameda, as defined in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District." The control tower does not convey the curvilinear aspects of the Moderne style found in the buildings facing the mall or quadrangle, but includes other aspects of the style used throughout the administrative core. Building 19 is constructed of smooth reinforced concrete, contains a vertical accent in the projecting control tower, and is fenestrated with horizontal band windows. The north, south and eastern sides are more utilitarian in keeping with the shops area that they face, but retain horizontal incised banding while the windows are spaced in a more utilitarian fashion. No character-defining features have been identified on the interior of Building 19.

The history of the station during the Cold War illustrates that Building 19, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[21] Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Building 19, therefore, does not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

HISTORIC RESOURCES INVENTORY
1. Historic.Current name: Building 19, Flight Control Tower
3. Location: Taxiway 4 **NAS Alameda Map** P-18 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION5
6. Proptery category: District Number of resrouces documented: 85
7. Existing condition: a 1- to 4-story, concrete and wood frame building with an irregular plan and flat, parapeted roof. The building's identifying feature is the observation tower which has a railing and various antenna, etc., above a polygonal room with angled glazed sections separated by metal mullions. Below is a deck with a metal railing on top of the fourth story of the building. The rest of the original, concrete section of the building has 2 stories and a variety of metal-framed windows with single and multiple-light hopper sash and wooden and metal doors.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

5. SHOPS AREA

5.1. Architectural Vocabulary of the Shops Area

The Shops Area was given the least attention of all areas of the original NAS Alameda, at least with respect to its architectural detail. The Shops Area buildings were tucked away from view, behind the Administrative Core, and had little public use or visibility. The shops, in short, were designed strictly for function rather than appearance. Nonetheless, the shops buildings do share some architectural features and elements with other parts of the base, including the hangars and the Administrative Core. The Shops Area includes Buildings 6, 8, 9, 42, 43, 44, 91, 92, 101, 102, and 114. The Shops Area is bounded on the west by First Street, on the east by Fifth Street, on the south by Avenue F, and on the north by Avenue C.

A first measure of the strictly functional nature of the Shops Area is the fact there is no uniformity of design there. There are various building types in the Shops Area. These may be roughly divided into the wooden buildings, the concrete buildings, and the steel framed buildings. The concrete shops buildings are 6, 8, 42, 43, and 44. The wooden buildings are 91, 92, and 101, 102 and 114. The final shops building is Building 9, which is a steel framed and stucco-sided building that is structurally and visually similar to the hangars.

5.2. Surface Materials, Basic Building Forms

The Shops Area buildings are not uniform in terms of basic structural elements and must be assessed as groups of buildings.

One group comprises Buildings 91 and 92. These are wood framed shops buildings, of a type built by the Navy at many locations during World War II. The form is defined by two large shed roofed shop wings with a shallow gable-roofed light monitor at the center; this form is shown in **Photograph 42**. The buildings are sided in a horizontal board, called "drop siding"; the manner in which these board are joined is shown in **Photograph 43**. Building 102, a small building near Buildings 42, 43, and 44, is also sided in drop siding.

Buildings 101 and 114 are flat-roofed, wood-frame warehouses with office wings, located in the Shops Area near the center of the historic district, south and east of Building 1. At Building 101, the office and warehouse spaces are quite different in appearance. The building is U-shaped, with the office wing at the west enclosure of the U. Both the office and warehouse wings are sided in flush horizontal boards with shiplap joints, similar to the siding used on the Chapel (Building 94). An early addition was built on the north side of the building; it was sided in wooden drop-siding, rather than the flush board used elsewhere. The south side of the office wing was recently re-sided with a vinyl siding, in the shape of drop siding. The building is shown in **Photograph 44**; **Photograph 45** is a detailed view of the vinyl siding on the office wing.

Building 114 is similar to Building 101 in that it is a flat-roofed, wood frame and wooden sided warehouse building with an attached office wing. Building 114, however, is sided in a v-groove wooden board, not found elsewhere within the historic district. There appear to be no major alterations to Building 114; it is shown in **Photograph 46**.

A discrete group of buildings in the Shops Area are three concrete shops at the western edge of the area; these are Buildings 42, 43, 44. These small buildings are shown in **Photograph 47**. These are flat-roofed, reinforced concrete buildings. These buildings include relatively few windows and doors. Although similar, the buildings are not identical. Building 43 includes a flat-roofed light monitor.

Buildings 6, 8, and 9 are unique among the Shops Area buildings. Building 6 is a concrete fire station building, located within the Shops Area. It was not a shop functionally and was designed in a manner more consistent with the Administrative Core than with the remainder of the Shops Area. It is finished in smooth concrete. It is a C-shaped building with a two-story facade and two wings of vehicle bays. The basic form of the building is shown in **Photograph 48**.

Building 8 is a huge two-story reinforced concrete warehouse, built during the pre-war period of construction at the station, when high-quality, permanent construction was still being emphasized. Like the fire station, Building 8 shares many structural elements with buildings in the Administrative Core, including its flat roof, smooth concrete finish, and horizontal emphasis. **Photograph 49** shows one side of this massive building.

Building 9 is a very tall storage building adjacent to the Hangars Area, and it is structurally more similar to the hangars than to the remainder of the Shops Area buildings. Like the hangars, it is a steel-framed building with a tall concrete bulkhead and thick stucco walls. **Photograph 50** offers a general view of this hangar-like building.

The character-defining elements of the Shops Area buildings include:

- Drop siding, v-groove siding, and flush wooden board siding on wood frame buildings.
- Smooth reinforced concrete surface on Buildings 6, 8, 42, 43, and 44.
- Stucco siding on Building 9.
- Hangar-like form of Building 9.
- Characteristic monitors on Buildings 90 and 91.
- Vertical accents at the entry to Building 8.

Design review considerations include:

- The wooden siding on the World War II-era buildings will likely need to be repaired or replaced at some point. The wooden siding should be replaced in kind; vinyl siding would not be appropriate. The newer vinyl siding is shown in Photograph 43. In addition to its inappropriate appearance, vinyl siding can trap condensation moisture and contribute to dryrot in the underlying siding and framing.

It would be appropriate to consider policies that treat the wood frame buildings (Building 91, 92, 101, 102, and 114) with a wider degree of latitude than with the concrete buildings and Building 9. The World War II-era temporary buildings were built to a much lower standard and are generally not consistent with the overall design of the base. Measured in terms of the uniform design of the original base, the World War II-era wood frame buildings make the least contribution to the overall quality of the historic district.

5.3. Windows and Doors

The Shops Area buildings include a variety of windows and doors, consistent with the fact that very different building types are represented there. The pattern of windows and doors differs chiefly between the wood frame World War II buildings, on the one hand, and the earlier concrete and steel frame buildings on the other.

The wood frame buildings -- 91, 92, 101, 102, and 114 -- include wooden windows, of a variety of patterns. Building 91 and 92 generally include large wooden industrial sash with a center pivot operational window; this window type is illustrated in **Photograph 51**. A similar type of wooden industrial sash was used on the warehouse wings of Building 101. The office wing of Building 101 included an unusual three-over-three double-hung wooden window. On the south side of the office wing of Building 101 (where the vinyl siding was installed), the windows were replaced with one-over-one aluminum double-hung windows. Building 114, while otherwise similar to Building 101, was fitted with steel industrial sash, except in the office wing, which includes two-over-two double-hung wooden sash. The wood frame shops also include several types of sliding wooden industrial doors.

The concrete Shops Area buildings -- Buildings 6, 8, 42, 43, and 44 -- include a much richer variety of windows and doors. Of the five, Buildings 42, 43, and 44 are the least diverse, owing at least in part to the fact that they are much smaller than the others. These concrete buildings were fitted with steel industrial sash, similar to steel windows throughout the historic district.

Building 6, the fire station, also includes steel industrial sash. These windows include both awning and hopper type operations sash, i.e. windows hinged at either the top or bottom. An example is shown in **Photograph 52**. The building includes numerous vehicular doors, most of which have been replaced through the years with metal roll-up doors. A few original doors, however, are still in place; an example is shown in **Photograph 53**.

Building 8 includes steel industrial sash throughout. It also includes numerous original steel personnel doors, one of which is shown in **Photograph 54.** As a warehouse, the bulk of the doors in this building are wide industrial openings. Most of the industrial doors appear to have been replaced.

Building 9, as noted, is structurally similar to the hangars and, not surprisingly, includes hangar-like doors and windows as well. It is characterized by horizontal bands of very tall steel

industrial sash, as shown in **Photograph 55.** It also includes tall doors that resemble hangar doors, as shown in **Photograph 56.**

In summary, the character-defining windows and doors in the Shops Area include:

- Wooden industrial sash in Buildings 90 and 91.
- Steel industrial sash in all of the concrete buildings.
- Some original steel vehicular doors in Building 6.
- Original steel personnel doors in Building 8.
- Hangar-like doors in Building 9.

Design review considerations for these windows and doors include:

- Approaches to the two building types (wooden and concrete) must be different because different types of windows and doors were installed there. It would be inappropriate to adopt one Shops Area window or door for use in these different building types.
- It would be appropriate to adopt a policy of greater latitude in dealing with the wooden buildings, as opposed to the concrete buildings. The temporary wooden buildings add proportionately little to the character of the historic district.
- Buildings 6 and 8, although located in the Shops Area, should be managed as if they were part of the Administrative Core because they are unified architecturally with the Administrative Core buildings and include many of the same windows and doors.

5.4. Features and Elements

As strictly utilitarian buildings, relatively few of the Shops Area buildings were fitted with architecturally distinctive features and elements. The World War II-era temporary wooden buildings, for example, include no distinctive features or elements. The same observation generally holds true for the smaller concrete buildings, Buildings 42, 43, and 44. Building 9 is integrated architecturally with the Hangars Area buildings. Like the hangars, it includes few applied decorative elements.

Buildings 6 and 8 are notable, however, for the degree to which these utilitarian buildings were integrated into the overall design theme of the base, as exemplified by buildings in the Administrative Core. Building 6 includes the quoin-like incised concrete features, found throughout the Administrative Core; this may be seen in Photograph 53.

Building 8 is even more integrated with the design of the Administrative Core. It features a strong vertical element at the entry, similar to the entry pavilion of Building 1; this may be seen in Photograph 49. It also includes a curved doorway surround, similar to the main entry to Building 18; it is also shown in Photograph 49. Building 8 includes a very handsome curving concrete canopy at the loading docks area; this may be seen in **Photograph 57.**

In summary, notable architectural features are rare in the Shops Area, restricted to Buildings 6 and 8. Among the key character-defining features and elements are:

- Incised concrete bands in the wall panels between windows on Building 6.
- Strong vertical entry pavilion in Building 8.
- Curved entry at Building 8.
- Curved concrete canopy in Building 8.

Design review consideration for these features are the same as those for similar features in the Administrative Core area. These concrete features are quite sturdy and would be affected adversely only through very major additions or modifications to the buildings in question.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. B10. Significance (cont.):

Historic Context

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[1]

In 1989 a major earthquake struck the San Francisco Bay Area. NAS Alameda sustained major damage to the airfield runways, taxiways and parking aprons and buildings. The north wing of the Operations Building had major damage and much of it was removed in 1993. This began the alterations to the fundamental form of building constructed during World War II. Contractors performed repairs on runways to restore flight operations crucial to the station's mission. Building 19-1 had been constructed in 1962 as an extension on the east side of the fire/rescue station attached to north of Building 19. The original part of the fire/rescue station was damaged and demolished in the 1989 earthquake, but the 19-1 addition remains.[2]

Building 491 was constructed in 1961 likely to serve as a supplemental power source for Building 19. A former opening on the east side is now filled with concrete blocks; otherwise the building appears unaltered and remains in its original location.

Evaluation

Buildings 19-1 and 491, were constructed during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the

technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the support function of these building to the Control Tower did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). They were unremarkable in its use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda resources are utilitarian in design, materials, and construction methodology and are relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). The prefabricated building (Building 19-1) is typical of Cold War-era buildings located on military bases. These facilities do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Buildings 19-1 and 491 were not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Neither Building 491 nor 19-1 possess historic significance and are not a contributing elements of the NAS Alameda Historic District.

Buildings 552, 553, 554, 555, 558, and 559 are inventoried as a group on this form because they are all electrical substations. Buildings 553 and 554 are located within the NAS Alameda Historic District, but are non-contributing elements. Building 552, also named the "Cartwright Substation," has a three-by-five bay plan with pilaster dividers. The west side has a metal overhang door in the middle of the bay with a concrete ramp entry and louvered vents. The south and north sides have five bays with louvered vents located at the base of the wall in each bay. The north side has two symmetrical metal service doors with concrete steps and three evenly spaced louvered vents. A dedication plaque dated August 18, 1988 is located on the north wall. A substation and transformer is located behind the east wall. (See Continuation Sheet.)

P3a. Description (cont.):

Buildings 553, 554, 555, and 558 are similar in design and construction. These buildings have a square or rectangular plan with a flat roof and parapet with an overhang of four to six inches. The concrete tilt-up walls are textured with vertical grooves. Each of these substation buildings includes a single metal personnel door, a double-metal personnel door, and louvered vents. Building 559 is a substation without a building exterior. The roughly rectangular grouping of transformer equipment is enclosed by a fence **(Photograph 3)**. Equipment includes a shed roof metal shelter, a transformer, a breaker unit on the north with doors on the south and north side of the switching equipment lockers.

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

All of these electrical substations were constructed in 1973, with few modifications since then. Building 552, the main electrical substation, was also known as the Cartwright Substation in honor of Richard A. Cartwright's service with the City of Alameda Bureau of Electricity. This building area also encompasses a large fenced compound that includes eight switches and a transformer set upon a concrete foundation.[2] Building 552 is also the largest substation covering a total of 28,566 square-feet. Buildings 553 (electrical substation #6) and 555 (electrical substation #8) were both designed to transmit 784kv, while Building 554 (electrical substation #7) was slightly smaller, transmitting 500kv. Building 558, electrical substation #14, includes 16 12kv switchgears with breakers, relays, and voltmeters. In 1993 a bilge and oily wastewater treatment facility was installed west of Building 558, at this point the substation was incorporated into the project to provide the necessary power to the new treatment plant.[3] Building 559, electrical substation #9, was constructed to transmit 1584 kV and is the only substation within this group without a concrete

structure. The series of transmission boxes are set upon a concrete foundation, but no structures was building around them.[4] All of these substations remain in their original locations with no apparent changes to the structure of the buildings.

Evaluation

The electrical substations, Buildings 552, 553, 554, 555, 558, and 559, were constructed during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] In the larger context of the naval operations in California and nationwide during this period, the public works function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While they retain some integrity to their original construction, the buildings were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). These facilities did not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of these buildings was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Building 360 is a large, roughly rectangular building with many additions covering 179,070 square feet. There are also four small raised-ridge metal building next to Building 360 which are designated Buildings 360 A-D. Building 360 has a concrete foundation, stucco clad exterior and a flat roof. A horizontal band of green corrugated fiberglass panels runs around most of the building high on the wall, with a row of three two-by-four windows interrupt the east end of the fiberglass band. While the building is generally rectangular, there are several small elements which protrude out from the rectangular form **(Photograph 1)**. (See Continuation Sheet.)

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***P3a. Description (cont.):**

On the north side of Building 360 two elements extend out from the plane of the exterior wall. One is concrete and has three north-facing metal roll-up doors, a metal double personnel door and sets of two-over-three metal framed windows. Attached is a shelter with a concrete block wall and corrugated metal shed roof. At the other end of this side is a corrugated metal element with a low-pitched, front gable roof. It has a set of metal double doors and a single personnel door with a window. Just east of this element are two roll-up metal doors and a metal personnel door which open onto an exterior loading dock. Two large two-by-five louvered vents are centrally located on the north side **(Photograph 1)**.

On the south side of the building are two exterior loading docks with a concrete ramps. Opening on to the docks are a metal roll-up doors and personnel doors. Adjacent to this side of the building and abutting one of the loading docks is Building 610, a raised ridge metal building with a flat roof and metal roll-up door, which opens onto the dock. Along the roofline, large cylindrical metal vents rise from the roof and hover over the roofline. There is also a below grade personnel entrance of concrete steps with metal railing that lead to a single metal personnel door **(Photograph 2)**.

The west side of Building 360 has four elements that jut out from the rectangular plan of the main element of the building, three small and one large. The three small elements are concrete with three-light window sets, some of which have been boarded up. One of these also has a metal personnel door and a large metal sliding door, which both open onto an exterior loading dock. Another metal personnel door and two metal roll-up doors open onto the same dock from the main element of the building. A third personnel door opening has been boarded up. A second exterior loading dock with a metal roll-up door is also on this side. The fourth, larger element attached to the west side is concrete, roughly square, and has small loading docks in the two corners where it joins the main element of Building 360. These docks are covered by rounded, conical roofs and have metal sliding doors with an inset personnel door, and an adjacent metal personnel door. The west wall of this element is sheathed in metal panels and has a large metal roll-up door with an inset personnel door, and a single metal personnel door with metal stairs. A raised metal service door is on the north side **(Photograph 3)**.

The east side has three elements which extend out beyond the main element of Building 360. These are all concrete and have boarded up windows. One has a long course of window openings which contained sets of four windows each. Also interspersed on this side are sets of metal double doors with boarded up windows. A single exterior loading dock with metal roll-up door and concrete stairs is roughly midway on the east side. The main entrance to the east side is centrally located and has recessed metal double doors with boarded up window and transom lights. It is accessed by concrete stairs and a metal pipe railing; metal awning poles without fabric remain above the entry stairs **(Photograph 4)**.

Buildings 360 A-D: (Photograph 5) Building 360 A, B, C, and D are made of raised ridge metal with shed roofs and full width metal roll-up doors. They are located in the northwest, northeast, southwest, and southeast corners of Building 360.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible. O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy.[1]

The development of new technology associated with faster aircraft resulted in the need for new facilities to relieve overcrowding in the O&R department during the 1950s. Building 360 was constructed by Dinwiddie Construction Company of San Francisco in 1953 as a permanent jet engine overhaul plant. Kaiser Engineering, Inc. designed the architect and engineer drawings for the building. The building rests on mushroom shaped pilings four feet above the ground so that utilities underneath the building, such as electrical, fuel and water lines, can be easily accessed and repair work could be accomplished quickly to prevent any slow down of production. The 300 x 500 feet structure contained a 30 x 220 feet office building and a 90 x 100 feet paint room when first constructed (**Photograph 6**).[2]

In August 1945 the first turbo jet engine, a General Electric Model I-16, was overhauled at Livermore, but O & R officials moved all tools and equipment to Building 5 on NAS Alameda to set up a shop. The jet overhaul quickly outgrew the acre of space allotted to them in Building 5 and moved to two subsequent buildings. In 1946, overhaul and repair facilities on NAS Alameda were lagging behind the quickly advancing jet engine technology. Funds for a new jet engine overhaul plant were not granted until 1951 after the start of the Korean War. Even before the building was completed, machinery and tools were relocated from Building 66 to Building 360. The building was designed for later expansion, if required, in that the bulkheads could be removed if an addition was required.[3]

NAS Alameda was the first jet engine overhaul facility on the west coast (Building 66) and the new building made it the largest. The majority of the workload when the building first opened consisted of J33, J35, J47, J48, and J57 jet engines as well as R3350 and R4360 reciprocating engines. The building serviced engines from the West coast, Pacific overseas bases and carriers, as well engines from west of the Mississippi River. The J48 jet engines were serviced for the U.S. Air Force and could be repaired in 30 minutes.[4]

Shops within Building 360 included a paint shop, a sheet metal/metal spray shop, a non-destructive testing investigation shop, a blast shop, a welding/casting, and heat treating shop, a machine shop, engine assembly/disassembly shop, plating shop, grinding shop, lathe and drill shop, electrical maintenance shop, and others. A balance shop in the building was responsible for balancing overhauled engine parts for NAS Alameda as well as parts from Ames Laboratory on NAS Moffet Field used for wind tunnel experimental work. Once parts are balanced, they are sent to the Supply Department and ready to be shipped out to squadrons as far away as China. The balance

shop also was responsible for complete overhaul, disassembling, inspection, rework, and assembly of J48 impellers and turbine rotors.[5]

In the late 1950s a 20 x 100 foot mezzanine level was added over the storage area as well as a lean to addition to the northeast corner. In the early 1970s Engine Decanning, was relocated to Building 360 from Building 166 and the vacated space in the building houses NARF's Fleet Van Support Program. Engines decanned include the TF41, TF30, T56, J52, and J65.[6]

Buildings 360 A through D were constructed in 1985 as maintenance aircraft storage to support Building 360.[7]

Evaluation

Buildings 360 and 360 A - D were built during the Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] In the larger context of the naval operations in California and nationwide during this period, the O&R function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The buildings retain some integrity to when they were built, but are unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology (NRHP Criterion C / CRHR Criterion 3). These buildings do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). While these buildings played a valuable role in the operations of NAS Alameda during the Cold War era, servicing technologically sophisticated aircraft and weapons systems, they did not play a significant role in their research, design, testing and evaluation, functions that might have imbued it with significance or exceptional importance (as would need to be the case for Buildings 360A-D which are less than 50 years old). Thus, Buildings 360 A-D do not meet the standards established under Criterion Consideration G or the CRHR special considerations for properties that are less than 50 years old.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Fleet Recreation Area includes Building 542, two former baseball diamonds (Buildings 251 and 252) converted into one recreation field, a basketball court (Building 253), and tennis courts (Building 254). The playing fields are west of Building 542. Building 542 is a stubby 'T' shape 15,563 square foot building with a flat roof and parapet. The walls are concrete tilt-up construction and have a decorative band of vertical grooves just below roof height. There are aluminum downspouts on both the north and south sides. The main entrance is on the north side and is shorter than the east and west parts of the building (**Photograph 1**). The entry has a projecting flat roof with closed boxed eaves supported by two concrete posts. The entrance is recessed and has a grid of metal framed fixed lights surrounding double metal and glass personnel doors. Some of the windows and the doors are boarded over. (See Continuation Sheet.)

*** B10. Significance: Theme:** **Area:**
Period of Significance: **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The resources of the Fleet Recreation Area, Buildings 251, 252, 253, 254, and 542, are not eligible for listing in the National Register of Historical Places (NRHP) or the California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***Recorded by:** R. Herbert and K. Clementi ***Date:** October 8, 2009 ☒ **Continuation** ☐ **Update**

***P3a. Description (cont.):**

The rear or south side of Building 542 has a similar, but deeper projection. The southern projection is more centered, but also has a lower roof than the east and west, flat projecting roof with closed boxed eaves and supporting concrete posts (**Photograph 2**). Under the projection the west and most of the south walls are fixed windows in metal frames and two double metal and glass personnel doors, all of which are boarded over and are surrounded by a narrow concrete walkway. On the roof a louvered screen element conceals the ventilation equipment. Metal single and double personnel doors, probably for emergency exits, are irregularly located in the concrete walls of the east and west wings.

Buildings 251 and 252 are no longer in existence as baseball fields; they have been converted to a single, large playing field (**Photograph 3**). Building 253 is a paved rectangular area containing two basketball courts. Building 254 includes four tennis courts and is surrounded by a chain link fence. A chain link fence also divides the area, creating two courts on either side.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. This group of resources did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did they make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

On August 2, 1971, ground broke for the new Fleet Recreation Center on a seven acre lot south of Avenue N, now West Hornet Avenue. Captain James Holbrook initiated the project and received funding from the Bureau of Navy

Personnel in November 1970.[1] Construction of the Fleet Recreation Center began in 1972 by the Seabees (CBU-409), who worked with Self Help over the next four years to complete the project. Building 542 was almost complete by July 1975, at which point it had an eight-lane bowling alley and the dining area in the western portion of the building was mostly complete. The Seabees and Self Help workers developed the grounds for the football field, baseball diamonds (Buildings 251 and 252), tennis courts (Building 254), and basketball courts (Building 253) in 1975. By July 1975, the football field and baseball diamonds were completed. The baseball diamonds were incorporated into the southwest (Building 251) and northeast (Building 252) corners of the football field.[2]

The Center's grand opening was on September 11, 1976, at which point it had exceeded its original loan of $810,000 to a final total of $1.2 million. The Fleet Recreation Center was developed for the use of active military, dependents, retired military, and reserve personnel on active duty. The Special Services Officer oversaw the operations of the Fleet Recreation Center, except for the snack bar and the 2500 square-foot restaurant, which were run by the Navy Exchange. The configuration and maintenance of the baseball fields changed during the 1980s. The diamond in the southwest corner (Building 251) was removed and by the end of the decade the entire field was less manicured and the remaining diamond was only visible if well irrigated. By the closing of the base the abandoned playing fields were deserted; however, between 2002 and 2005 the baseball and football fields were redeveloped into a single playing field. The tennis and basketball courts remain in their original configuration, though they have since been resurfaced.[3]

This area continued to serve as a recreation center through base closure in 1997. Building 542 has been used as a pizza parlor and laundry facility in addition to its original purpose of general recreation. The building's final property record from 2008 described its use as including a 4,750 square-foot Exchange Cafeteria, a 2,550 square-foot laundry and dry-cleaning center, and an 8,250 square foot bowling alley. It remains unclear when the laundry facility was added to the building. Currently Building 542 is not in use; however the only apparent changes to the exterior of the building have been the boarding up of broken windows and doors.[4]

Evaluation

The resources of the Fleet Recreation area, Buildings 251, 252, 253, 254, and 542, were built during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather,

NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] In the larger context of the naval operations in California and nationwide during this period, the MWR function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Thus, while they retain some integrity to when they were constructed, these resources were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations of the period (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while the Fleet Recreation area resources served a valuable function on NAS Alameda during the Cold War era, their construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Buildings 76 and 134 are not eligible for listing in the NRHP either individually, nor are they located within the NAS Alameda Historic District. They have a NRHP status code of 6Z.

P1. Other Identifier: Buildings 76 and 134

P2e. Other Locational Data: Gym: 1101 West Red Line Ave; Pool: 1111 West Red Line Ave; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Enlisted Men's Pool (Building 76) and Gymnasium (Building 134) are treated as a group on this form because of their location, period of construction, and common recreational use.

Constructed in 1942, Building 76 is a tall, one-story wood frame rectangular building on a concrete foundation, with a low-pitch gable roof with metal louvered vents in both east and west gables. It is clad in vinyl siding placed over wood, which was documented in 1992. The building is approximately 25,000 square feet and houses an indoor swimming pool and racquetball courts, and is located immediately north of and attached to the gymnasium Building 134, constructed in 1945, by a centrally located one-story low-gabled enclosed breezeway which runs from it's south side to the north side of Building 134 (**Photograph 1**).

There are single story extensions at both ends of the Building 76. On the west end is a wood-sided structure with a low double convex-truss type roof, where the racquet ball courts are located. Access to this portion of the building is through two deeply recessed entryways on the west end of the building which have three single ground-level wooden personnel doors (**Photograph 1**). On the west façade there are two sets of raised wooden personnel doors on which were accessed by staircases which have been removed. At the east end of the building there is a one-story flat-roof partial width concrete addition. The east end has a roll-up metal freight door with an inset personnel door in the center, a louvered personnel door to the south and two boarded windows to the right. To the north of the addition there are two concrete handball courts (**Photograph 2 and 3**). Fenestration includes nine groups of four by two aluminum awning windows in three rows. Two of the center groups have louvered vents in place of the second row of windows on the north and south sides.

At the ground level of the south side of Building 76 west of the breezeway there is a partial fence which sits on a raised redwood deck and is perpendicular to the building. The deck between the two buildings has an asphalt walkway on its south side which leads east to a wooden ramp that runs north up to a personnel door. Above the deck are two metal roll-up freight doors which are positioned between the fence and the ramp. To the east of the door there are two small one-over-one aluminum sliders, one of which is boarded over. On the other side of the breezeway, at ground level of the north side of the building, there is a metal roll-up freight door with an inset personnel door and seven sets of boarded windows in wooden casings and a set of double solid metal doors.

In the middle of the south side of Building 76 is the breezeway which connects the two buildings. Both east and west sides of the breezeway have two square vents, one large, one small and three one-over-one aluminum sliders with wooden casings. The other personnel entrance to the pool can be accessed on the south side of the building to the east of the breezeway and has a concrete staircase with metal handrails which lead up to two single personnel solid metal doors with two sets of boarded windows on either side.

***Recorded by:** C. Brookshear, K. Clementi, and C. McMorris ***Date:** September 29, 2009 ☐ **Continuation** ☒ **Update**

Building 134 is a large rectangular building on a concrete foundation and is attached to Building 76 by the previously described enclosed breezeway (**Photograph 4**). The gymnasium covers a total of 36,959 square feet. Its two-story height is topped by a low-pitched side-gable roof accessed by metal exterior ladders on the northeast and northwest sides and pairs of metal louver vents are located in the gable peaks. There are single-story shed roof extensions on the north and south sides (**Photographs 5, 6**). The walls are clad in horizontal vinyl siding with large louvered vents located in the upper story on the north and south sides. The façade faces south with a centralized, inset stuccoed entrance including aluminum-framed and glazed double doors flanked by fixed windows. The building has a series of frosted single story aluminum framed hopper windows along the north and south sides; the windows are grouped in fours. Double sets of similar widows without the frosted glazing are located along the height of the second story also on the north and south sides. The west side includes a large metal roll-up door with a shed roof extension over it and three metal personnel doors, of which one is a double door. The personnel door furthest south has a small flat roof extension above it and the other single personnel door has a concrete ramp with metal railing leading up to it. On the east side is a similar metal roll-up door and shed roof extension with two personnel doors to the north of it. Also on the east side is a personnel door providing access to the northern extension.

B10. Significance:

This update form was prepared to provide additional information about Buildings 76 and 134, to assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Although the station contributed vital functions to the Navy during the Cold War, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Contractors Johnson Drake and Piper constructed Building 76 constructed in 1942 at a cost of $111,000. It served as a swimming pool facility for NAS military personnel. When Building 134, the gymnasium, was constructed in 1945 to the south of the Building 76, the two were connected by a small enclosed breezeway.[4] In 1956 one of three close-circuit TV cameras was mounted on the roof of the building to aid the Control Tower in Building 19 in viewing areas of the runway which were previously unobservable because of the surrounding buildings.[5]

Building 134 was constructed in 1945 by the Dinwiddie Construction Company of San Francisco as a multipurpose gymnasium for NAS military personnel. Throughout the active years of NAS the gym offered a complete athletic program which included swimming, boxing, volleyball, badminton, basketball, weight lifting and handball among others. Group activities such as athletic tournaments' and dances were also offered. The equipment room supplied all outdoor gymnasium activities including softball, hardball and football as well as loaner equipment for parties, skiing, camping, gun range activities and other off-base sports activities.[6]

Originally built in 1945 the interior of the gymnasium was renovated in 1959 to better serve the athletic needs of its personnel. When the renovation was complete there was also a sportsman's armory where 12-gauge shotguns, 22-caliber rifles and pistols could be checked out. The Oakland Raiders football team temporarily leased a portion of Building 134 in the early 1960s for their practice facility. They used the football field in the quadrangle between Building 2 and Building 4. During the first half of the 1970s the interior of the gym was also improved as well as the game fields associated with it. In 1972, the roof was repaired and painted and in 1987 the roof was replaced as well

[6] Building 134, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; "Something for Everyone at Gym; Staff Provides Facilities for Full Athletic Program," *The Carrier*, 4 January 1957.

as the electrical and faulty infrastructure, which was upgraded.[7] Additional renovations were made to both buildings over the years, including window / door replacements, vinyl exterior cladding, and addition of a contemporary awning on the south side of Building 134. More recently, exterior steps for the racquetball courts on Building 176 were removed.

Evaluation

Although construction of the Enlisted Men's Pool and Gymnasium were part of the original period of construction on the station, and falls within the period of significance for the NAS Alameda Historic District (1938-1945), they have been heavily modified and do not convey potential association with the district's significance under NRHP Criterion A (CRHR Criterion 1). Furthermore, the lack of historic integrity prevents Buildings 76 and 134 from conveying any potential architectural design significance they may have had under NRHP Criterion C (CRHR Criterion 3). The original historic district significance discussion stated,

> The major finding was that, although no buildings were found to be individually eligible for listing on [sic] the National Register of Historic Places, an historic district comprising the permanent and non-permanent buildings, open spaces, and street system in the central core of the naval air station and the officer housing adjacent to the core was identified. Under Criterion A of the National Register Criteria for Evaluation, the contextural [sic] theme of the district is the development of U.S. Navy bases in the San Francisco Bay Area for World War II; the period of significance is 1938-1945. The integrity of the district is high with few non-contributing structures in contrast to the rest of the base, which has changed considerably since World War II and no longer conveys a strong impression of the naval air station in the period of significance.
>
> … Under Criterion C, the buildings in the historic district have a continuity of style and a high degree of architectural integrity enhanced by the retention of landscaping and parklike open spaces.[8]

The buildings considered to be non-contributors were those within the district that were either built outside the period of significance (i.e., post 1945), or those built within the period of significance that had lost integrity through alteration. Buildings 76 and 134 were placed in the latter category because the buildings were so altered through multiple changes over time that they do not contribute to the district.[9] Research undertaken for this project in building plans, base maps, and aerial photographs indicates that while the buildings were originally constructed during the period of significance, many exterior and interior changes have been made since that time including replacing the original wooden exterior with metal siding on both buildings, replacement of original wooden windows with aluminum, infill of windows with vents on Building 76, removal of windows on the south side of Building 134 and later addition of aluminum windows, enclosure of playing courts on the west side of Building 76. The setting of the area has also changed since the period of construction of the buildings with the expansion of the runway to the northwest corner of Building 76, which required the removal of playing fields to the north of Building 76. Over time, many buildings in the area west of the Pool and Gymnasium have also been removed and the area currently includes a

skate park. Buildings 76 and 134, therefore, do not convey association with the context of World War II and are not eligible for inclusion in the historic district.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[10] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 76 and 134, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they lack direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Buildings 76 and 134 do not meet the criteria for listing in the NRHP individually, nor are they located within the NAS Alameda Historic District and are not eligible for inclusion in the district.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The hazardous material storehouses, Building 614, 615, and 616, have similar architectural elements. Buildings 614 and 615 are located within the NAS Alameda Historic District, but are non-contributing elements. They are rectangular warehouses set on concrete foundations with low sloped, front gable, corrugated metal roofs that had slight extensions over the bay and personnel doors. The walls are clad in prefabricated corrugated metal siding with metal corner boards and metal louver vents near the base of the walls. The size and the amount of doors varies between the buildings; however all of the bay roll-up metal doors have solid transom panels. (See Continuation Sheet.)

***P3a. Description (cont.):**

Building 614 is located east of the airfield and west of Building 5. It is the smallest, covering 960 square feet, with two roll-up metal doors on the south side and single roll-up metal doors on the east and west sides. Additionally there are solid metal personnel doors located on the west and south sides.

Building 615 is located south of Building 5 and has the largest square footage at 2,400. It has the same plan as Building 614, aside from having four roll-up doors located on the south side which are accompanied by two personnel doors. Building 616, measuring 1,800 square feet, is located in the southeastern portion of the naval base, east of Building 170 and has a slightly different plan than the other two buildings. The south façade has a total of four bays with roll-up metal doors; it also has a series of clerestory windows to the east of the bays. The north side contains a second set of four bays with roll-up metal doors and a metal and glazed personnel door on the west end. The west side has a single, aluminum-framed sliding window, the rest of the side is obstructed from view by a portable storage container. The south side includes a single roll-up metal door. Building D-13 is a covered metal storage bay to the east of Building 616.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category range from small pre-engineered structures to large steel or wood frame warehouses. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Buildings 614, 615, 616 were constructed in 1982 for the purpose of hazardous storage. Building D-13 was constructed in 1984, also for hazardous storage. Historically, Building 614 was used for paint storage, Building 615 stored electrical equipment and parts, though it now stores hazardous materials. Building 616 served as office space and material storage in additional to hazardous materials storage. According to building records, the buildings were

modified in 1984; however, the modification was not disclosed. All four buildings appear to be unmoved from their original location.[2]

Evaluation

Buildings 614, 615, 616 and D-13 were constructed during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time as storage. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the storage function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although they retain a measure of integrity from when they were constructed, they were unremarkable in their use in routine fleet support, and were not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda buildings are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These buildings are typical of Cold War-era storage facilities located on military bases. These buildings do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Buildings 614, 615, 616 and D-13 are not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Built in 1941, Buildings 355-359 appear to be one of two versions of the "Standard Magazine: High Explosive Arch Type" plan which is a single arch, earth-covered reinforced concrete magazine with blast barricade opposite a single steel door.[1] The construction of the magazines also appear to have been part of a lump funding request for high explosive magazines, fuse and detonator magazines, small arms magazines, a pyrotechnic magazine, smoke drum storehouses, and an inert storehouse.[2] Because of the hazardous function, the Navy situated magazines away from the main portions of the station.

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

Evaluation

Because of the standardization and ubiquity of magazines on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the

[1]US Navy, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," October 2006, 27.

[2] US Navy, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," October 2006, A1.1.

best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda
are addressed by this Program Comment as none have been identified as a contributor to a historic district. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

Buildings 355-359 do not contribute to the historic district because they lack historic significance within the context of the station's initial construction and development during World War II. As noted, these magazines were a necessary component of the operations and fleet support functions on NAS Alameda, but the function of Building 355-359 for ammunition storage was not central to NAS Alameda World War II activities, and do not represent an important component of the station's facilities that would render them historically significant.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These magazines are not eligible for listing in the NRHP or CRHR because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. This group of magazines, were used for ammunition storage, which was not central to NAS Alameda World War II operations, or A&R activities, nor did it the resource make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

In the larger context of the naval operations in California and nationwide during this period, the magazine and ordnance handling function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These buildings were unremarkable in their use in routine fleet support, and were not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 355-359 were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general (NRHP Criterion A / CRHR Criterion 1). These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These facilities do not have a direct or important association with a historically significant individual, nor are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

The buildings located in this magazine area—Buildings 353, 354, 441, and 442—are not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. (See Continuation Sheet)

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

***P3a. Description (cont.):**

Building 441 and 442 are located between Buildings 353 and 354 **(Photograph 3)**. Building 441 is a thirteen by nine foot concrete building with a shed roof measuring 117 square feet. The east side has a personnel door with boarded up corner windows on the northeast and northwest corners with rectangular openings below each window. The west side has a corner window on the southwest side. The south side was not accessible **(Photograph 4)**. Building 442 is a 360 square foot building measuring 18 feet by ten feet and is a composed of a two-story concrete tower and a one-story shed roof section on the south **(Photograph 5)**. The east side has a metal staircase with hand rail to the second story of the tower. Boarded up corner windows are located on the northeast, northwest, and southwest corners with rectangular openings below each window. The one-story section has a personnel door on the west side. The south side was not accessible.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. This group of buildings is not eligible for listing in the NRHP or CRHR because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. The group did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on Naval Air Station, North Island.

Buildings 353 and 354 were constructed in 1952 as part of a $2.3 million contract (NOy 72364) to expand aviation facilities. This contract included the construction of a new runway, fuel storage, multiple magazines, ammunition lockers, and storage buildings in addition to a perimeter road.[1] These high explosive magazines appear structurally unaltered since construction. The activities conducted within these buildings were limited to high explosives, such as aircraft bombs and mines, storage.[2]

[1]US Navy, "History of the US Naval Air Station, Alameda, Captain R.R. Waller, US Navy Commanding, 1 July 1952 to 31 December 1952," Box 1 of 2, 5757-1b, Naval Air Station Command Histories, 27 Volumes, 1940 to 1992, RG 181, US Naval Shore Establishments, National Archives and Record Administration, Pacific Region, (San Francisco).

Building 441 was constructed in 1959 to serve as a guard tower for the nearby high explosive magazines located in the western end of the naval base.[3] Aside from the boarded up windows, Building 441 appears unaltered since its construction. Building 442 was constructed in 1959 to serve as a control center and watch tower for the western magazine area. The building originally contained a back up generator and transformer in addition to its use as a watch tower.[4] Aside from the boarded-up windows the building appears unchanged since construction and is currently abandoned.

Evaluation

Because of the standardization and ubiquity of magazines on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

These resources were built during Cold War operations on NAS Alameda, and were part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] In the larger context of the naval operations in California and nationwide during this period, the magazine and ordnance handling function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These buildings were unremarkable in their use in routine fleet support, and were not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This form addresses 89 housing buildings constructed on NAS Alameda between 1963 and 1966. This housing was constructed as part of a construction program to replace inadequate housing and shares design and construction history. Visually and conceptually these are divided into three groups, single family officers' housing, multi-family officers' housing and multi-family enlisted housing. Each group will be described separately. (See Continuation Sheet.)

Evaluations of the housing addressed on this form are in two categories. NAS Alameda constructed 49 of these buildings under the Capehart funding program. The Navy built another 40 buildings addressed by this form with appropriated funds. The 49 houses constructed under the Capehart funding program have been evaluated using the contextual data developed under the Program Comment for Wherry and Capehart era Family Housing at Air Force and Navy Bases. The other 40 properties built with appropriated funds have been evaluated separately under standard methods applying the criteria for the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR). (See Continuation Sheet.)

***P3a. Description / P5a. Photographs (cont.):**

Single Family Residences

Most of the 32 single family buildings are located along Barbers Point Road and Pearl Harbor Road; two units are located among the 1940s officer housing as infill in the residential area of the station (the residential area is in the northeast corner of NAS Alameda). Addresses are listed in **Table 1** below. The buildings were part of a multiyear program to redevelop family housing on the base. Buildings are set off the streets in park-like grassy areas with scattered plantings. Most of the streets in the area were altered to have slight curves or not align with other streets.

Table 1. Single Family Residences

FH-778	100 Lemoore Road	2701 Lemoore Road	1965	--	1,880

Most of the buildings consist of repeating building plans, A, B, C and M, and are one-story Ranch style houses clad with stucco, with a brick chimney and gable roof with composite roof shingles. Plans B and A are very similar four bedroom nearly rectangular houses with irregular shaped floor plans that are mirror images of each other except for an additional window on the front façade of Plan A between the recessed main entrance and carport (**Photograph 1 and 2**). Plan C has an 'L' shaped layout with recessed entrance located in the 'L' (**Photograph 3**). Plan M has a rectangular plan; however, most houses lack the planned brick chimney (**Photographs 4 and 5**). Windows consist of three sizes of metal framed sliding windows, small, medium and large. Each building has a paved driveway and partially enclosed wood siding carport wall with a shed roof addition off the back and a fenced area at the rear of the building (Plan B and A) or to the side (Plan C). The most common alterations are to the carport area with additions off the back and partial or full enclosure of the sides and front opening to such buildings as FH-730, 732, 733, 734, 749 and 766.

Four houses that lack identified plans are spread throughout the residential area: FH-775 and 776 are located with the 1940s officer's housing, FH-777 is a two-story residence at the corner of W. Essex Drive and Pearl Harbor Road, and FH-778 is located on Lemoore Avenue across from FH-752. FH-775, 776, and 778 have the same floor plan with alterations. Buildings FH-775, 776, and 778 are of the same design. They each have a rectangular plan clad in stucco with a gable roof. A carport with exposed purlins and a partial vertical plank wall is located on one end and a recessed porch is located at the other (**Photographs 6 and 7**). A patio area is located behind the carport. A brick chimney is centrally located on the rear wall with a sliding glass door to one side. Windows consist of three sizes of metal framed sliding windows, small, medium and large. FH-775 has been altered to enclose the recessed end area on the northwest end with vertical wood planking (**Photograph 8**).

FH-777 is a two-story minimal traditional house that has a rectangular plan clad with stucco and a gable roof. A flat roof carport projects from the southwest corner of the house facing the street with a slightly recessed main entrance (**Photograph 9**). The southeast corner on the first floor is also recessed. Fenestration includes three sizes of metal framed sliding windows—small, medium and large—and the rear of the house has a door at the northeast corner.

Multi-Family Officer Housing

Twenty-one officers' multi-family housing buildings form two areas within the residential area of the station (the residential area is in the northeast corner of the station). The main area is on both sides of Orion Street between Midway and Pearl Harbor. Barbers Point Road forms the eastern boundary. A second group consisting of Buildings 779 through 781 is along the east side of Lemoore Road. Addresses are listed in **Table 2** below (buildings used for fire department practice have not received new addresses). The buildings are set off gently curving streets in park-like grassy areas with scattered plantings. Driveways and paved off street parking serve multiple buildings. Buildings 738-764 had fenced paved drying yard adjacent to the buildings, remnants remain around the vacant buildings.

Buildings 738-742 and 753-764 utilize three different apartment plans (D, E, and F) which are combined with carports (one for each unit) in variations to form each building. The buildings are all two-story rectangles with side gable roofs (**Photographs 10 and 11)**. In buildings with five or six units the carports are incorporated into the building, with units above and to the sides (**Photograph 12**). Four unit buildings have one story carports with a flat roof attached to the ends of the buildings. The wood frame buildings are clad in stucco with built up gravel roofs. Exterior stairs lead to a full length second floor balcony on the main façade. The balcony also provides shelter for the first floor entrances. Small porches with sliding doors are located on the back side of each unit, usually off the kitchen portion of the apartment. Windows consist of three sizes of metal framed sliding windows, small, medium and large. Large windows are placed in the living/dining room area of the apartment and most of the bedrooms. A majority of the units are type E containing three bedrooms, unit type F contains two bedrooms and unit type D four bedrooms. As a result, buildings containing the four bedroom D units have more large windows. The kitchen area has medium sized windows and the bathrooms small windows. In buildings with four E type units additional doors have been added to the second floor providing direct access to one of the bedrooms.

The most common alterations are to the entrances. Wheelchair ramps have been added to Building 738, 740 and 742 for one of the first floor units. The free standing type E unit of Building 738 has been converted into a community laundry room and a patio added to the front and a rear window has been converted to a smaller window type. Buildings 755,758-764 have been used for City of Alameda Fire Department training. As a result the roofs have holes, most windows are broken and the interiors are damaged. However, these buildings are more likely to have nearly intact drying yards.

The 36 enlisted family housing buildings form a contiguous area on the south side of the residential area of the station (the residential area is in the northeast corner of the station). This area is bounded by Corpus Christi Road on the north, Tower Avenue (formerly Avenue F) on the south, Orion Road and Serenade Place on the east and Moonlight Terrace on the west. Addresses are listed in **Table 3** below.

FH-836	103 Glenview Road	Not Assigned	1963	4 G, 2 H	5,262
FH-837	101 Glenview Road	Not Assigned	1963	4 H	4,680

The buildings are set off gently curving streets in park-like grassy areas with scattered plantings. Driveways and paved off street parking serve multiple buildings. Each building had a fenced paved drying yard adjacent to the building. Most of these have been removed in the rehabilitated units, remnants remain around the vacant buildings. There are seven repeated plans for these buildings and four additional individual plans. All the plans utilize three different apartment plans (G, H, and J) which are combined with carports (one for each unit) in variations to form each building. The buildings are all two story rectangles with side gable roofs. In buildings with three or six units the carports are incorporated into the building, with units above and to the sides (**Photograph 12**). Four unit buildings have one story carports with a flat roof attached to the ends of the buildings (**Photograph 13**). The wood frame buildings are clad in stucco with built up gravel roofs. The roofs of the rehabilitated buildings (FH 800-812 and 816-822) have been changed to composite shingles. Exterior stairs lead to a full length second floor balcony on the main façade. The balcony also provides shelter for the first floor entrances. Small porches with sliding doors are located on the back side of each unit, usually off the kitchen portion of the apartment. Windows consist of three sizes of metal framed sliding windows, small, medium and large. Large windows are placed in the living/dining room area of the apartment and most of the bedrooms. A majority of the units are type H containing three bedrooms, unit type J contains two bedrooms and unit type G four bedrooms. As a result, buildings containing the four bedroom G units have more large windows. The kitchen area has medium sized windows and the bathrooms small windows. In buildings with four H type units additional doors have been added to the second floor providing direct access to one of the bedrooms.

The most common alterations are to the entrances. Wheelchair ramps have been added to several of the rehabilitated buildings for at least one of the first floor units. Buildings 800, 804, 811, 812, 831, 821, and 822 have added wheelchair ramps (**Photograph 14**). In rare instances a carport bay has been enclosed. This occurs in Building 819 and 822. The balcony of Building 800 has been rebuilt of treated redwood. Buildings 814, 823-837 have been used for City of Alameda Fire Department training. As a result the roofs have holes, most windows are broken and the interiors are damaged. However, these buildings are more likely to have nearly intact drying yards.

B10. Significance (cont.):

Historic Context

During the 1950s and 1960s the military had three programs for funding personnel housing: the Wherry program, the Capehart program, and annual appropriations. Military housing from the period is frequently identified through its funding source. Naval Air Station Alameda (NAS Alameda) improved its housing during the 1960s using both Capehart program funds and appropriated funds. The history of these programs and their role in the development of NAS Alameda is discussed in the following paragraphs.

The Navy began construction of NAS Alameda as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Following World War II, all military branches sought to increase family housing for service members. The Navy was faced with several challenges. It had not provided housing for married enlisted members until World War II, instead expecting single male sailors to sleep aboard their ships, and families to find their own housing. Even officer housing was limited to those in charge of base operations. The dawn of aviation and other land-based activities began shifting this policy. During World War II, the Navy began providing married housing for top grades of enlisted men, and later expanded it to all enlisted. The need for officer housing also increased, as the rate of married Naval officers increased from 25 percent in the 1920s to 80 percent in 1955. [1]

The Navy struggled to meet this growing need for housing. Military appropriations were minimized through the Truman and Eisenhower administrations. At the same time, advances in bombing and missile technology focused most attention and spending on the Air Force. At the local level, many Naval installations were located in urban areas already suffering a civilian housing shortage. As a result, it was difficult for the Navy to acquire additional land for housing construction. Yet the need was becoming acute. Following World War II, technically trained staff reported lack of adequate housing as a major reason for leaving service. [2]

In the 1950s and 1960s Congress created three funding paths for military housing: the Wherry program, the Capehart program, and annual appropriations. The Wherry and Capehart programs supplied developers with Federal Housing Authority mortgages to back the construction of housing. The Wherry program operated from 1949-1956, and the Capehart program operated from 1955-1962. These programs provided mortgage security for developers constructing military housing on or near bases. The federal government was reluctant to become involved in housing development, and these programs were designed to meet the need for housing through public-private partnerships.

[1] Kathryn R. Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," June 2007, prepared for the United States Department of the Air Force and the United States Department of the Navy, 45, 20.
[2] Kathryn R. Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," 16-19, 87.

Only when flaws in these programs became clear did the government directly provide housing through appropriated funds. [3]

Since NAS Alameda was constructed just prior to and during World War II, the base included housing for officers (19 officers' quarters), thirty units for married enlisted men (CP-1 – CP-30), and plenty of permanent (Buildings 2 and 4) and temporary barracks (replaced with the housing discussed on this form). The base was also in middle of the Bay Area providing plenty of off base housing opportunities. Consequently, the base did not receive any housing improvements until the 1960s. The first improvements were carried out under the Capehart program. [4] The construction program planned for 900 units located east and west of Main Street. Two hundred units were constructed under the Capehart program beginning in 1962 as the program was terminated. These properties were completed in 1963. The remaining 700 units were constructed with appropriated funds between 1963 and 1966. While differing in funding sources, construction was part of a single plan to update station housing declared inadequate in 1958. The Navy developed the plans and layout under the direction provided from the Capehart program.

Under the Capehart program, the military planned and managed the housing, while private contractors secured mortgages to construct the housing and were paid back though the rental fees for the units. The Navy developed a well organized Capehart program, recommended as a model for other branches. The Capehart program was discontinued in 1962 with developments in progress like on NAS Alameda finishing in the following year. The Bureau of Yards and Docks constructed additional family housing in the following years through direct appropriations. Housing under both programs followed the same guidelines and cannot be visually differentiated. At NAS Alameda, Capehart and appropriated fund housing replaced existing World War II housing between Midway and Tower Roads and east of the officer's quarters. Additional Capehart housing was provided in the area east of Main Street, but was previously transferred out of Navy control and is not included in this study.[5]

The Navy instituted family housing to help retain skilled personnel, and was influenced by civilian federal housing programs. It developed its own set of standards that referred to civilian Federal Housing Authority (FHA) guidelines. In 1960 the Navy developed standard floor plans, a "family of plans." Exterior alterations and variations were acceptable, but deviation from the floor plan required bureau level authorization. However, standardized building materials introduced after World War II were required for all buildings. BuDocks and the Navy preferred single-family units and duplexes, actively avoiding row houses and larger multifamily buildings. NAS Alameda combined multi-unit housing into four and six-plexes, a slightly irregular exemption.[6]

Overall neighborhood development encouraged curving streets for traffic control and aesthetics. This altered the orthogonal plan of the east side of NAS Alameda as the housing was reconstructed in the 1960s. Housing density was limited to five units for each acre for semi-detached units at the densest, and four units per acre for single family houses. The Navy eschewed landscaping in favor of constructing the largest and most comfortable houses for the available funds. Yet, the Navy encouraged the inclusion of family friendly amenities like playgrounds. [7]

Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," 83-84, 89, 93; INFADS; USGS, *Oakland West* (Washington, D.C.: USGS, 1959); USGS *Oakland West* (Washington, D.C.: USGS, 1968).
[6] Kuranda, R., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," 68, 88-89, 91, 114, 88.
[7] Kathryn R. Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," 68, 118, 119, 129, 132.

The funding appropriations and guidelines set size and dollar limits on the housing units. In 1959 no more than $16,500 could be spent for each unit constructed under the Capehart Act. Appropriated funding housing, constructed after the Capehart Act ended in 1962 set both financial limits and square footage limits based on rank (2,100 for generals, 1,400 for majors and lieutenant colonels, 1,250 warrant officers, flight officers, and commissioned officers below captain, and 1,080 for enlisted). Single family residences were reserved for higher-ranking officers. The maximum number of bedrooms and bathrooms was also dictated by rank. Landscape features such as roads, green space and other elements often separated officers and enlisted personnel housing. [8]

Evaluation

The Navy and the Advisory Council for Historic Preservation have developed the Program Comment for Wherry and Capehart Era Family Housing at Air Force and Navy Bases which addresses buildings constructed with Capehart program funds. This Program Comment does not apply to buildings constructed with appropriated funds. Because of this distinction, the evaluation of the 1960s family housing has been divided based upon funding source. NAS Alameda constructed 49 of these buildings under the Capehart funding program. The station built another 40 buildings addressed by this form with appropriated funds.[9] The Capehart program funded all of the enlisted multi-family housing and portions of the single and multi-family officers' housing. The table below indicates the two groups.

Building Number	Navy Address[10]	City of Alameda Address	Built Date	Funding

Capehart Program Housing

All branches of the military have had large amounts of housing constructed under the Wherry and Capehart programs. The Army initiated studies of Wherry and Capehart housing in 2001 in preparation of a Program Comment with the ACHP. Discussions held between the Army, ACHP, NCSHPO and other interested parties indicated that Capehart and Wherry neighborhoods may be significant illustrations of post-World War II suburbanization.[11] The treatments developed for Capehart and Wherry housing assume NRHP eligibility for this reason. The Navy's contextual study, *Housing an Air Force and a Navy: The Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962),* identifies three houses designed by Richard J. Neutra at Mountain Home AFB and the Catalina Heights neighborhood at Naval Base Ventura County as having particular importance within this context. The housing on NAS Alameda was not identified as having particular importance. The Program Comment also requires the Navy to inform developers considering Capehart era properties that they may qualify for historic preservation tax credits. The Navy has completed its identification requirements for these properties under Section 110 of the NHPA.

Appropriated Funds Housing

The housing on NAS Alameda constructed between 1964 and 1966 with appropriated funds are not associated with the Capehart funding program that conferred eligibility on the buildings discussed previously and do not have significant associations with the development of post World War II suburban development (NRHP Criterion A, CRHR Criterion 1). The construction of the appropriated fund housing on NAS Alameda occurred late in the development of post-World War II military housing. At the time of construction, the Navy had developed standardized floor plans for housing units which had been in use for at least three years and the street patterns

[11] Advisory Council on Historic Preservation, "Capehart and Wherry Era Housing," http://www.achp.gov/army-capehartwherry.html, accessed January 5, 2010.

reflected developed suburban trends. The housing military personnel occupied the housing until the station's decommissioning. There are no indications that any of these individuals have achieved historical significance (NRHP Criterion B, CRHR Criterion 2). None of the designs used on NAS Alameda are associated with significant architects or builders, nor does the area retain the integrity of a suburban development (NRHP Criterion C, CRHR Criterion 3). Of the original 700 units (approximately 140 buildings) only 38 buildings remain (less than half). The buildings constructed east of Main Street (and off the current facility) as a part of the construction between 1963 and 1966 have been demolished. Those remaining on the station west of Main Street suffer from various levels of diminished integrity. Two buildings within the area have been demolished leaving only foundations. Another 7 have extensive fire damage (from fire department training use) that removed all windows, and damaged internal walls and roofs. Occupied multi-family buildings are altered by the frequent addition of wheelchair ramps. Single family houses have been altered with the addition of shed roofs to carports and enclosure of carports. It is concluded that the appropriated funds housing on NAS Alameda does not have significance within the framework of military housing, and lacks sufficient integrity to be eligible for listing in the NRHP or CRHP. In addition the properties do not reach the threshold of exceptional significance required under Criteria Consideration G for properties that have achieved significance within the past fifty years.

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in these themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[12] In the larger context of the naval operations in California and nationwide during this period, the storage function the 1960s housing development did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The family housing area was unremarkable in its use for routine fleet support, and was not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda buildings are largely standardized in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These buildings are typical of Cold War era family housing units on military bases. These buildings do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of the 1960s housing units are not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Page 1 **of** 7 ***Resource Name or #** (Assigned by recorder) Housing - CPO 1-30

***Recorded by:** C. Brookshear and K. Clementi ***Date:** November 3, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of Officer Housing by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). In the previous study Chief Petty Officers' Housing (CPO 1-6, and 8-30) and Officers' Housing (FH-B through FH-I and FH-K through FH-U) were evaluated on a single form. This form updates Chief Petty Officer's Housing (CPO 1-6 and 8-30). CPO 7, originally excluded from the 1992 report, was later added to the historic district in 1997 (see Photograph 7). The Chief Petty Officers' Housing is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Chief Petty Officers' Housing

P2 e. Other Locational Data: 101-123 Corpus Christi Road, 100-111 Pensacola Road; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The CPO housing was constructed using two separate but similar plans. Some characteristics are present in all CPO houses. They are all wood-frame houses with low-pitch hipped roofs, wide, open eaves, and stucco siding. Fenestration consists of two-over-two double-hung wood-sash windows. Both plans include two recessed and raised concrete porches, located at opposite corners under the main roof. One porch is located on the front façade, and includes wood railing, concrete stairs with metal railing, and a five-light wood door. The rear porch also has wood railing and concrete stairs with metal railing; however, it includes two multi-light doors, one on either wall. CPO 1-13 between Pensacola Road and Corpus Christi Road were constructed from a 1940 plan, while the remaining houses (CPO-14-30) along Corpus Christi Road were constructed on a 1941 plan with fewer irregularities, but had right- and left-hand versions which were mirror images of each other.

CPO 1-13 each has a recessed front porch on one side of the main façade and an inset corner on the opposite side of this wall **(Photograph 1)**. The rear wall includes a ten-light French door atop a three-step concrete stoop located at the end opposite the rear porch **(Photograph 2)**. Six windows are located on the front side. The recessed porch has a single short window on the wall opposite the door. Two windows are paired on the projecting wall next to a single window, while two short and narrow single windows are located on the inset corner—one on each wall. The rear wall includes two pairs of windows—one short and the other full size. One window is located on the inside corner of the rear porch. One side wall has a group of three windows, while the other side has short and narrow paired windows. The front porch originally had a flower box along the side of the box for a rail. These flower boxes have been moved or removed. CPO Houses 4-6, 8-9, and 11-13 have their flowerboxes sitting behind the houses in the yard. The other flower boxes are completely missing. Wheelchair access ramps have been added to CPO 9 (ramp added in rear) and CPO 11(ramp added in front).

CPO 14-30 each has recessed front and rear porches in opposite corners. The front porch is on the right for the houses located on the south side of Corpus Christi Road except CPO 24 and on the left for houses located on the north side of Corpus Christi Road **(Photograph 3)**. These houses do not have an additional inset on the front as found on CPO 1-13. The French door on the rear wall is replaced by a five-light wood door with two five-light side lights **(Photograph 4)**. The side adjacent to the front porch has two large windows. The other side has a single window and another on the recessed rear porch. The only frequent change is the replacement or enclosure of the small square panel leading to the utility room. These have been replaced with louvered vents, solid material, or modern dryer vents (CPO Houses 14, 22, 25, and 27).

B10. Significance:

This update form was prepared to provide additional information about CPO 1-30 Housing, to assess if it retains historic integrity, and to evaluate its significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In the construction of Naval facilities, housing did not become a common part of base planning until the influx of sailors in World War I. Previously, sailors were expected to live on ship, and few facilities were provided for enlisted men or even non-critical officers. Shore housing for ship officers was not provided until 1899. The introduction of Naval Air Stations and other new facility types not tied to ships and shipyards required the inclusion of housing, as personnel could not be housed shipboard. Housing remained limited and senior officers charged with base operations had priority. Through the 1930s expenditures on base construction increased. The Bureau of Yards and Docks developed new bases creating individual master plans for each. Quarters at these new bases were designed for the site reflecting the local style, climate and materials. Detached housing was preferred, and built to minimum standards set by the Department of Commerce. As World War II began the top grades of enlisted men were offered married housing, the policy was later expanded to all enlisted families.[3]

The CPO housing on NAS Alameda was designed by the Bureau of Yards and Docks and constructed in two phases by contractors Johnson, Drake and Pipers. CPO units 1 through 13 were constructed in 1941 and the units 14-30 were constructed in 1942 after the area east of group one was filled in by dredging **(Photograph 6)**. The first and second phase of construction varies little in design and layout, as described in the descriptions above. CPO units 24 and 25, originally the easternmost units of the CPO housing, were relocated west of unit 14 across from units 2 and 3 in an area that was previously a playground **(Photograph 7)**. The relocation occurred in 1944 in preparation for the construction of new barracks east of the officer housing.[4] In 1966 the interiors were modernized with new flooring and forced air heating units as part of a base wide improvement in living quarters from the 1960s to 1970s.[5]

Evaluation

CPO housing buildings were built during the initial construction of the station, and are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[6] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[7] These are detailed on the attached sheets, and include the stucco surface, hipped roof form, recessed porch, and two-over-two double-hung wooden sash windows.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[8] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. CPO 1-30, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War Era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although the buildings do not individually, nor as a group, possess Cold War-era significance, the CPO Housing remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

***B14. Evaluator:** C. Brookshear and J. Freeman

***Date of Evaluation:** January 2010 / June 2010

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.&2. Historic/Current name: Officer Housing
3. Location: NAS Alameda Map I-L, 27-30 City/Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West CA
5. Quad Map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85

7. Existing condition: There are two types of houses: the first type, of which there are 29 aligned in rows on either side of the street north of Ave. C, are one-story, wood-frame, stuccoed houses with flat roofs and rectangular plans. A recessed entrance porch, raised on three steps and supported with one wood post is located at one end of the building; service porches are located in back. The doors are wood with one light; typical windows are four-light wooden hopper sash in wood frames. The houses have minimal foundation planting and a concrete sidewalk that extends to the street. The rows of houses face the street and have shared back yards.

The second type, of which there are 18, is a two-story, wood-frame, stuccoed house with a one-story wing on one side and a garage on the other. The main part of the house has a hip-roof; the wing and garage have flat roofs. The houses have stylistic features representative of the early Modern style such as a vertical row of small, square windows in the center of the facade that light the stairwell and entrance porches raised three steps that have one wall with three round openings and two square windows near the wood and glass entrance door. Wooden planters wall the edge of the porch. Typical windows have wooden hopper sash with two-over-two lights in wood frames. The garage doors are paneled wood with four lights across the top. Most of the houses have acquired fenced yards since they were built; they are evenly spaced on curving streets that set
the area apart as a residential development. They are landscaped with foundation shrubbery and mature palms and other trees. Newer housing has been built on peripheral land.

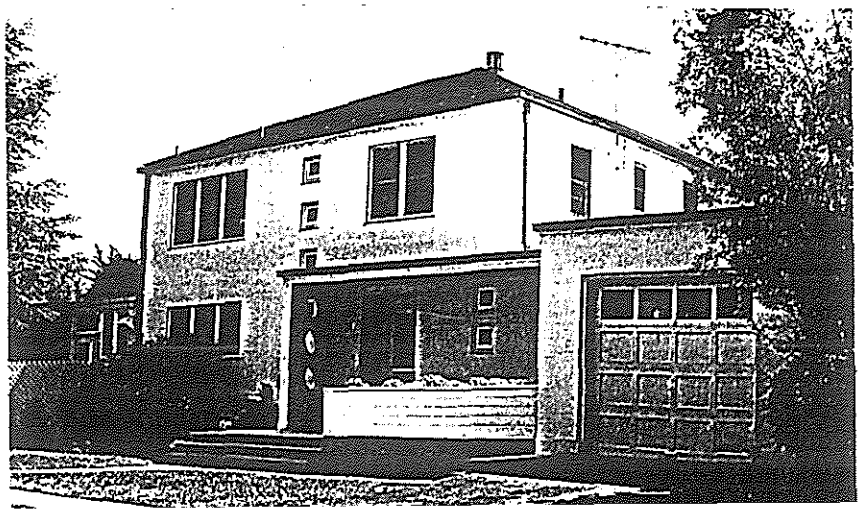
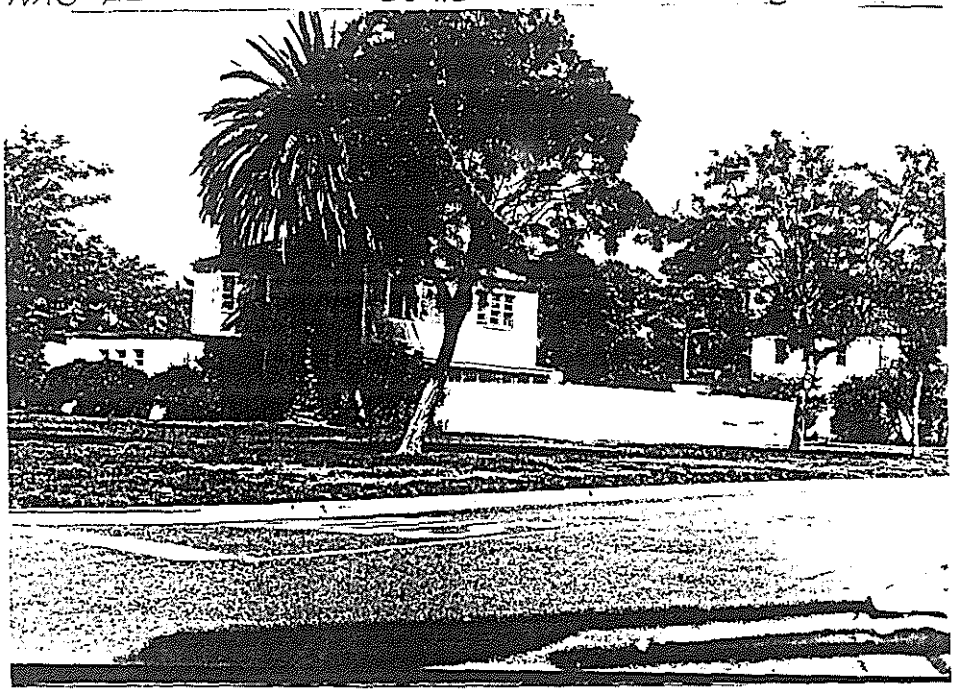
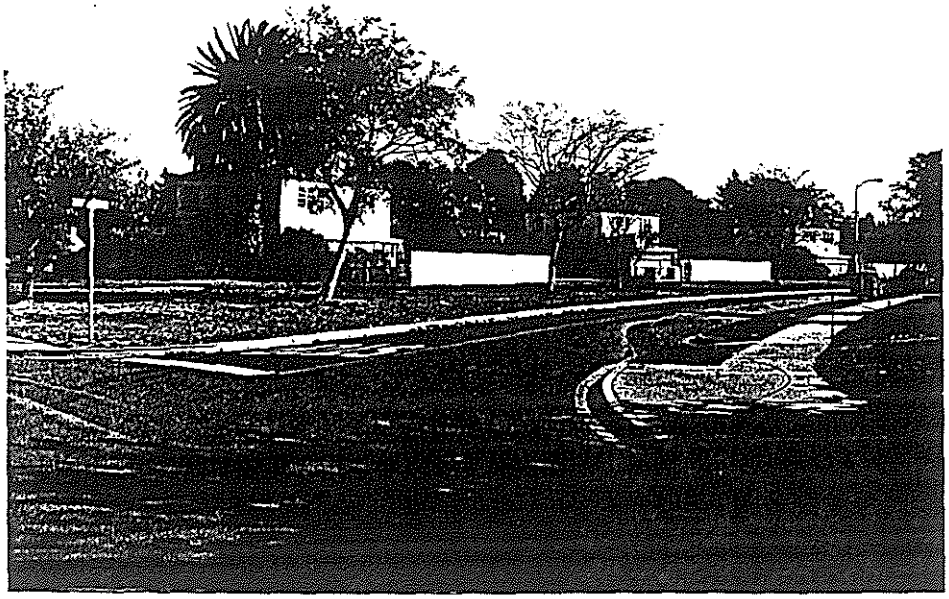
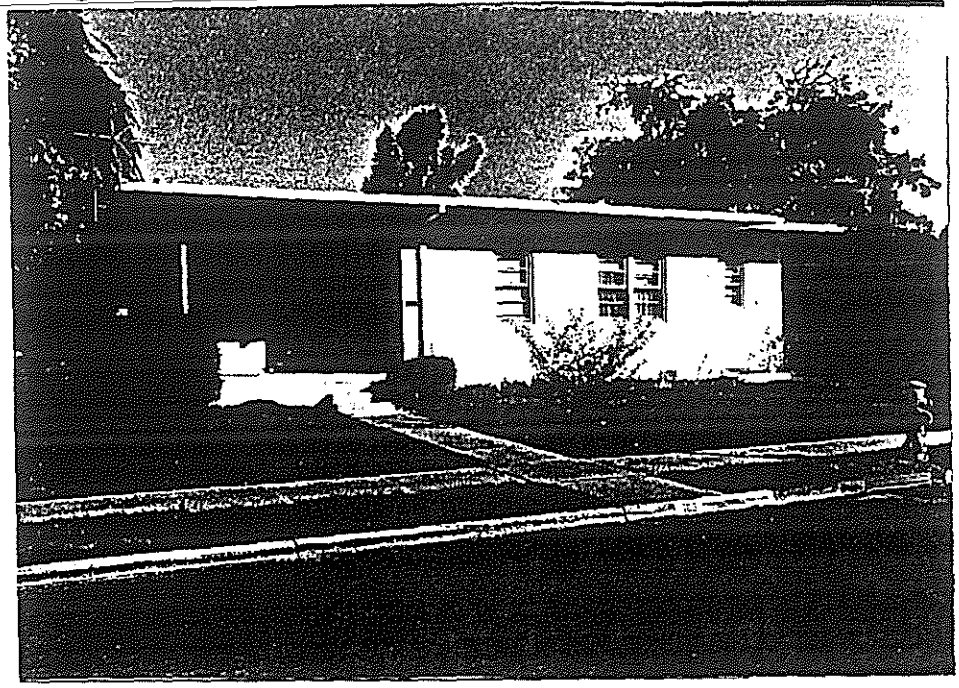
13. Threats: none

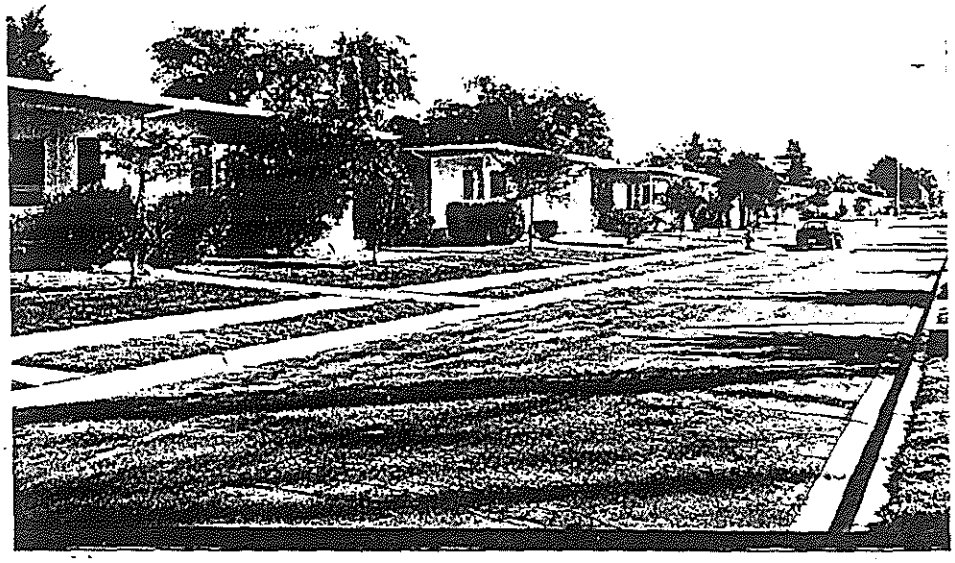


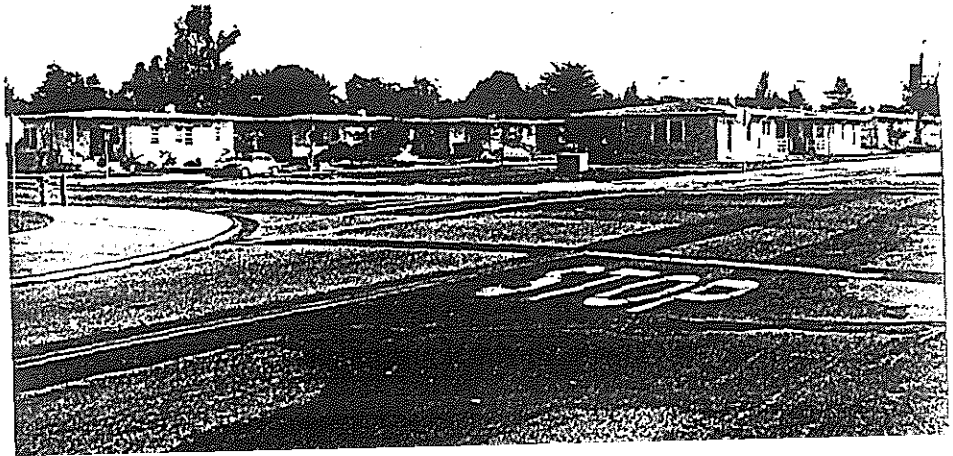
NAS ALAMEDA Senior Officer Housing











HISTORICAL INFORMATION

14. Construction date: 1941 Original location: yes
15. Alterations: none visible except for fencing around the type 2 houses.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: The officer housing contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1941 in an area adjacent to the central core at the end of Avenue A, a major cross-axis on the base that defines the northern edge of the district. Despite infilling with later housing, for the most part the area retains its historic character both in terms of the street pattern, landscaping, and architecture.
Under Criterion C, the two types of houses were designed in the simplified Modern style used in the permanent, non-residential buildings in the central core.

20. Sources: NAS Alameda records

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

6. RESIDENTIAL AREA

6.1. Architectural Vocabulary of the Residential Area

The Residential Area includes more buildings than any other area: 29 one-story non-commissioned officers' (NCO) quarters and 18 two-story officers' quarters. Although large in numbers, the buildings within the Residential Area are easily managed because there are only two building types there.

The character of the residential area is defined as much by the landscaping and street layout as by the architecture of the buildings; the landscape is discussed in greater detail in Section 7. The landscape and the pleasant residences combine to create an area that resembles a pleasant suburban tract street. The homes are not in a Moderne or Streamline Moderne style, nor are they of any easily identifiable historical style. The officers' quarters do repeat some features found elsewhere, most noticeably in their windows. The NCO quarters are much more severe, although they do include the same window patterns found on the Officers' quarters. While it is unusual for the uniformity of the buildings there, the general character of the area is more similar to a post-war housing tract than to the remainder of the NAS Alameda Historic District.

6.2. Surface, Roof, and Building Form

Both the two-story officers' quarters and one-story NCO quarters are wood-frame buildings, sided in thick stucco on concrete foundations. The basic form of the officers' quarter building is shown in **Photograph 58**; the NCO quarters building is shown in **Photograph 59**.

The NCO residence includes a shallow hip roof with broad overhang. It includes a recessed porch, supported by a single wooden post.

The officers' quarters building is much larger and far more complex. The building includes a tall two-story, rectangular core with a nearly pyramidal hip roof, as well as one-story, flat-roofed wings to either side. The roofs are without overhangs. One side wing is a one-car attached garage, the other is a sun-room. The presence of an attached automobile garage is an unusual element for a home from the late 1930s.

The character-defining elements of the surface, roof, and building form include:

- Stucco surface.
- Hipped roof form; these are the only hipped roofs in the historic district, except for Building 94, the Chapel.
- Recessed porch on the NCO house.
- Two-story core with one-story wings form of the officers' quarters buildings.
- Attached garages in officers' quarters.

Design review considerations for these buildings include:

- These residential areas may prove difficult to manage, depending upon the re-use options, because the uniformity of design calls for uniformity of future modifications, if the intended character of the area is to be preserved.
- If the re-use calls for residential uses for the homes, some degree of flexibility in design review will be needed to accommodate personal tastes in such inherently personal matters as paint colors and interior room arrangements and equipment. Greatest attention should be paid to the uniformity of the facade, especially with respect to the "soft" features, particularly windows and doors. These will be discussed below.

6.3. Windows and Doors

The residential units within the NAS Alameda Historic District are remarkably unaltered. It appears that all, or nearly all, of the original windows and doors are still in place. The windows in both housing types are two-over-two double-hung wooden sash, consistent with the original window pattern throughout the Administrative Core. The windows in the officers' quarters are detailed in **Photograph 60.** A typical window in the NCO quarters is shown in **Photograph 61.** Virtually all of the front doors are also original, on both types of housing. In the officers' quarters, the front door is wooden with four wooden panels and four lights. In the NCO quarters, the front door is a five-panel wooden door with sidelights. In addition to the entry doors, the officers' quarters retain original, or at least very early, garage doors. A typical garage door is shown in **Photograph 62**.

Character-defining windows and doors include:

- Two-over-two double-hung wooden sash in both housing types.
- Original wooden and glass doors on officers' quarters; wooden doors with sidelights in NCO quarters.
- Original garage doors in officers' quarters.

Design review considerations for these windows and doors include:

- The uniformity of this residential area, as well as the charm of these residences, can be attributed to a very large degree to the presence of so many old windows there. Conversely, the character of the area would be diminished greatly, were these windows to be replaced.
- The original doors also contribute to the uniformity as well as to the charm of this residential enclave.

If the windows or doors must be replaced, the first option should be to replace in kind. The aluminum double-hung windows, which prove acceptable in the Administrative Core, would

likely not work as well on these smaller buildings. The warmth of wooden windows is an important and appealing part of these various homes.

6.4. Features and Elements

The NCO quarters are simple structures with few decorative elements or features. The character of these building is defined in their basic form as well as their clustering in a unified streetscape.

The officers' quarters, by contrast, are much more complex buildings. The core of these buildings from an architectural standpoint is the central entry. Several elements give focus to the central entry. One such element is an unusual solid porch support with porthole openings; it is shown in Photograph 56. Also shown in that photograph is a column of small windows that light the stairwell. Another notable feature, present on all officers' quarters in the area, are the original copper gutters and downspouts.

In summary, the notable architectural features of the Residential Area include:

- Solid porch supports with portholes, present on officers' quarters.
- Column of windows to light the staircases in the officers' quarters.
- Original copper gutters and downspouts.

DEPARTMENT OF PARKS AND RECREATION **HRI#**
CONTINUATION SHEET **Trinomial**

Page 1 **of** 8 ***Resource Name or #** (Assigned by recorder) Housing – Officer's Housing

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 12, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of Officer Housing by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). In the previous study, the Officer's Housing (FH-B through FH-I and FH-K through FH-U) and Chief Petty Officers' Housing (CPO 1-30) were recorded on a single form. This form only updates Officer's Housing (FH-B through FH-I and FH-K through FH-U). Officer's Housing is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: FH-B though FH-U

P2 e. Other Locational Data: On former Naval Air Station Alameda; See also Table in P3a

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Officer's Housing is composed of three components as described by Woodbridge, a hip-roof main house, flat-roof garage and flat-roof service wing. However, two different plans exist for the housing based upon a variation on the service and garage wings. This variation affects the length of the front porch. The table below identifies the Officer's Housing and the respective type:

Building Number	Navy Address	City of Alameda Address	Plan Type
FH-B	100 Seattle Road	2805 Seattle Road	Long Porch
FH-C	102 Seattle Road	2765 Seattle Road	Long Porch
FH-D	100 Newport Road	2825 Newport Road	Long Porch
FH-E	102 Newport Road	2805 Newport Road	Long Porch
FH-F	104 Newport Road	2801 Newport Road	Long Porch
FH-G	106 Newport Road	2765 Newport Road	Long Porch
FH-H	100 San Diego Road	2865 San Diego Road	Long Porch
FH-I	102 San Diego Road	2835 San Diego Road	Long Porch
FH-K	106 San Diego Road	2805 San Diego Road	Long Porch
FH-L	108 San Diego Road	2775 San Diego Road	Long Porch
FH-M	100 San Pedro Road	2875 San Pedro Road	Short Porch
FH-N	102 San Pedro Road	2845 San Pedro Road	Short Porch
FH-O	104 San Pedro Road	2835 San Pedro Road	Short Porch
FH-P	106 San Pedro Road	2815 San Pedro Road	Short Porch
FH-Q	108 San Pedro Road	2795 San Pedro Road	Short Porch
FH-S	102 Pearl Harbor Road	2845 Pearl Harbor Road	Short Porch
FH-T	104 Pearl Harbor Road	2825 Pearl Harbor Road	Short Porch
FH-U	106 Pearl Harbor Road	2805 Pearl Harbor Road	Short Porch

In both plans the main house is a two-story hip-roof building with thick composite shingles. The flat-roof garage extends to the north and the service wing to the south. The main house has four wood frame hopper windows down the center, a set of three double hung windows to the south and two on the upper story to the north, the first story has the door. Windows on the sides of the main house are irregularly spaced groupings of two-over-two double-hung. The rear of the house has two groupings of windows, one group of four and another of three. The first floor fenestration has been altered by the addition of sun porches to all the houses. Most of the sun porches cover only part of the rear elevation leaving a pair of doors or an original set of three doors. Buildings FH-B, FH-F, FH-G and FH-L appear to have sun porches across the entire rear of the house. The sun porches have two four-light windows on the

State of California — The Resources Agency **Primary #** P-01-010084

side and modern sliding windows along the west side. An exterior door is located on the south side. The sun porches have slightly tilted shed roofs.

The garage and service wing variations create the most visual distinction between the two building forms. The long porch variation has a small room between the garage and main house and the front porch extends from the door across this room to the garage **(Photograph 1)**. The porch area contains a stack of two square windows and a single two-over-two window. Rather than a rail the porch is bordered by a flowerbox. The flower boxes have raised molding creating three panels on all houses except for buildings FH-E, FH-F, FH-H, FH-I, and FH-L which have flower boxes of horizontal boards. The porches are tiled although tile has been removed from House I and Astroturf covers the porches of buildings FH-F and FH-K. The garage has a paneled rollup door. Three windows are high on the side of the garage.

The short porch version does not have a room between the garage and main house, placing the garage next to the main house **(Photograph 3)**. As a result, the porch only has a stack of two square windows and smaller flower boxes. Astroturf has only been added to one porch on building FH-U. The service wing of these houses is slightly longer; including a small storage room. Two thirds of the front of the service wing was intended as an open service porch with half wall. This has been filled with a door with a transom and three, three-light windows between the door and the main house. The remaining portions of the service wing have irregular groups of small two-over-two windows. A wooden stoop with rail has been added to the service wing of building FH-T otherwise they are concrete stairs leading to the service door.

FH-776 is a later replacement of building FH-J.

B10. Significance:

This update form was prepared to provide additional information about the Officer's Housing, to assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In the construction of Naval facilities, housing did not become a common part of base planning until the influx of sailors in World War I. Previously, sailors were expected to live on ship, and few facilities were provided for enlisted men or even non-critical officers. Shore housing for ship officers was not provided until 1899. The introduction of Naval Air Stations and other new facility types not tied to ships and shipyards required the inclusion of housing, as personnel could not be housed shipboard. Housing remained limited and senior officers charged with base operations had priority. Through the 1930s expenditures on base construction increased. The Bureau of Yards and Docks developed new bases creating individual master plans for each. Quarters at these new bases were designed for the site reflecting the local style, climate and materials. Detached housing was preferred, and built to minimum standards set by the Department of Commerce. As World War II began the top grades of enlisted men were offered married housing, the policy was later expanded to all enlisted families.[3]

The northeast corner of the base was developed for officers housing away from the main operations part of the Station. It was designed with a curvilinear street pattern rather than the straight lines of the main base, to reflect a more suburban residential layout than military **(Photograph 5)**.

The housing for Junior and Senior Officers was designed by the Bureau of Yards and Docks and constructed in 1941 by contractors Moore and Roberts of San Francisco (buildings FH-E through FH-L and FH-N and FH-P), and Johnson, Drake and Piper (buildings FH-B through FH-D, FH-M, FH-O, and FH-S through FH-U). The Senior Officers' (buildings FH-B through FH-L) and Junior Officers' (buildings FH-M through FH-U) plans varied little

[3] US. Army Corps of Engineers, *World War II Temporary Military Buildings* (Champaign, IL: US Army Corps of Engineers Construction Engineering Research Laboratories, 1993) 33; Kathryn R. Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," June 2007, prepared for the United States Department of the Air Force and the United States Department of the Navy, 39; Kathryn R. Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," June 2007, prepared for the United States Department of the Air Force and the United States Department of the Navy, 44, 45.

from each other, with the exception of a wider front porch plan for Senior Officers.[4] Senior Officers' Housing was also slightly larger measuring 2,482 square feet compared to 2,287 square feet for Junior Officers.[5] During World War II, officer housing was limited to those in charge of base operations. For example, in 1945 building FH-U was inhabited by Commander Russell R. Rhodes and family, assistant Executive Officer who worked with the Civilian Personnel Department.[6]

Documentation did not reveal a specific construction date of the sun porch additions on the rear of the buildings; however, there is reason to suggest they were added in the 1960s when other housing construction projects were occurring on base.

Evaluation

The Officer's Housing buildings were built during the initial construction of the station, and are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[7] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[8] These are detailed on the attached sheets, and include the stucco surface, hipped roof form, two story core with one story wings, attached garages, two-over-two double-hung wooden sash windows, remaining original garage doors, porch supports with circular cut outs, column of windows lighting staircases, remaining original copper gutters and downspouts.

In the context of the Cold War-era themes, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda operations were not associated with these themes. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[9] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period.

CONTINUATION SHEET	Trinomial

Page 8 **of** 8 ***Resource Name or #** (Assigned by recorder) Housing – Officer's Housing

***Recorded by:** C. Brookshear and C. Miller ***Date:** November 12, 2009 ☐ **Continuation** ☒ **Update**

The Officer's Housing buildings, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C /CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although they do not individually, nor as a group, possess Cold War-era significance, World War II Officer's Housing (FH-B through FH-U) remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

6. Property category: District Number of resources documented: 85

7. Existing condition: There are two types of houses: the first type, of which there are 29 aligned in rows on either side of the street north of Ave. C, are one-story, wood-frame, stuccoed houses with flat roofs and rectangular plans. A recessed entrance porch, raised on three steps and supported with one wood post is located at one end of the building; service porches are located in back. The doors are wood with one light; typical windows are four-light wooden hopper sash in wood frames. The houses have minimal foundation planting and a concrete sidewalk that extends to the street. The rows of houses face the street and have shared back yards.

The second type, of which there are 18, is a two-story, wood-frame, stuccoed house with a one-story wing on one side and a garage on the other. The main part of the house has a hip-roof; the wing and garage have flat roofs. The houses have stylistic features representative of the early Modern style such as a vertical row of small, square windows in the center of the facade that light the stairwell and entrance porches raised three steps that have one wall with three round openings and two square windows near the wood and glass entrance door. Wooden planters wall the edge of the porch. Typical windows have wooden hopper sash with two-over-two lights in wood frames. The garage doors are paneled wood with four lights across the top. Most of the houses have acquired fenced yards since they were built; they are evenly spaced on curving streets that set
the area apart as a residential development. They are landscaped with foundation shrubbery and mature palms and other trees. Newer housing has been built on peripheral land.

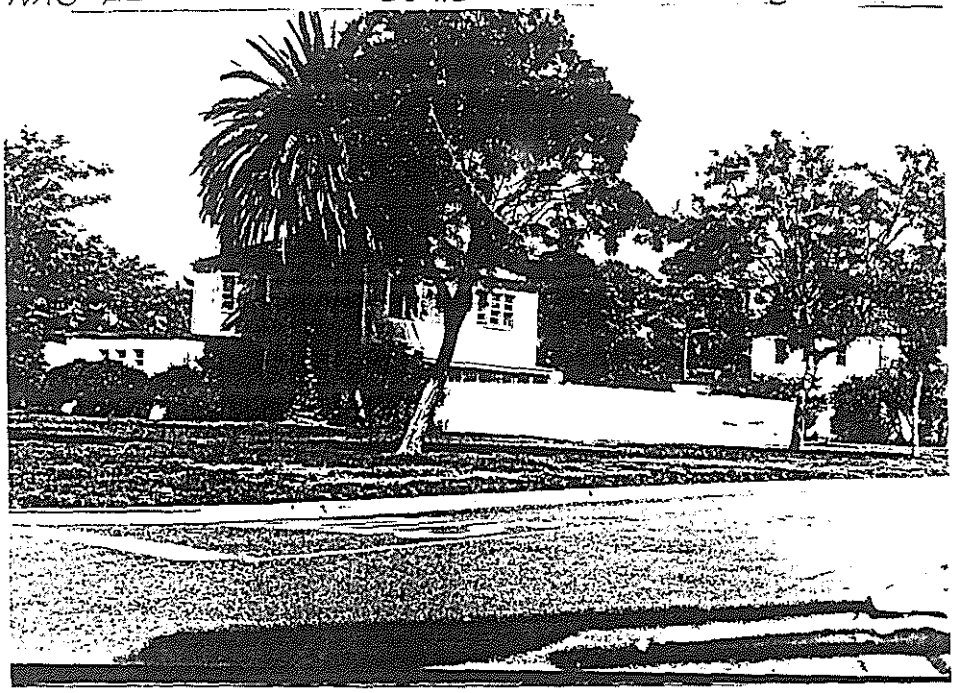
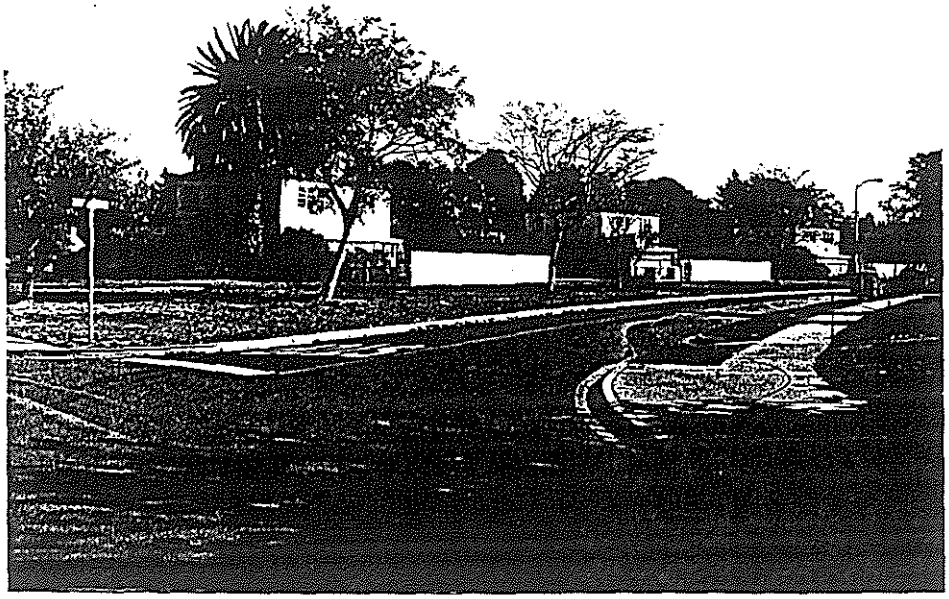
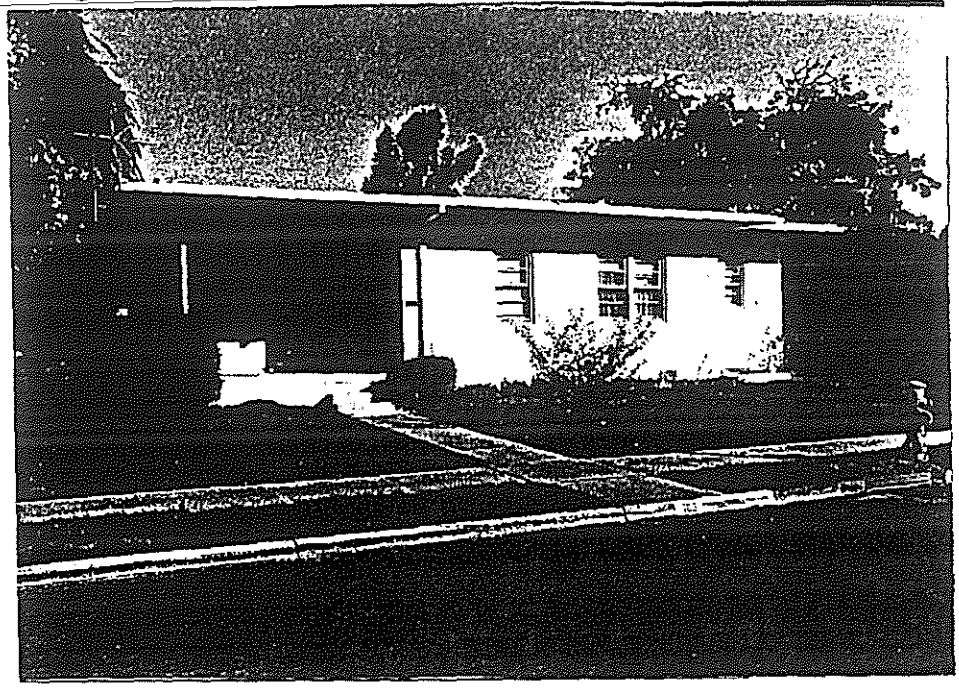
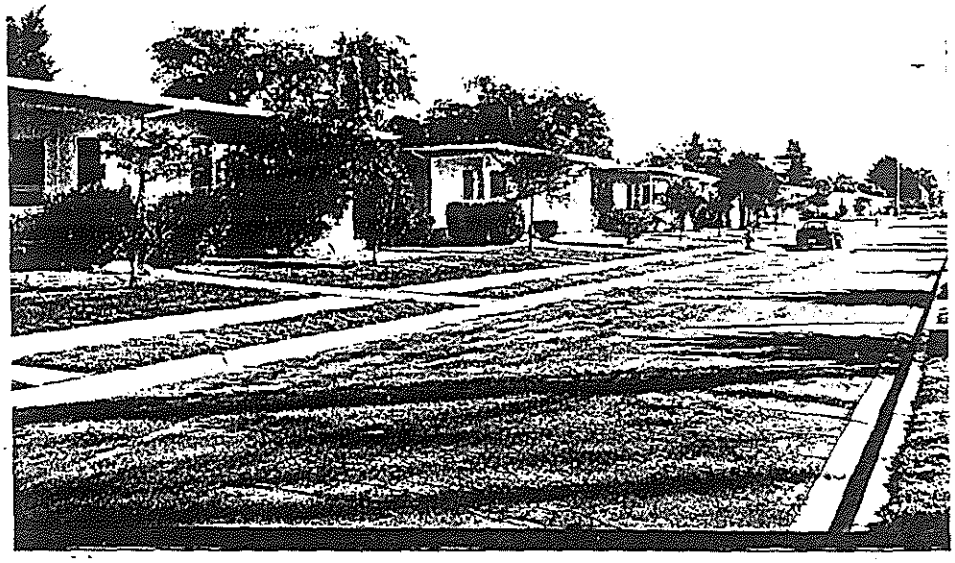
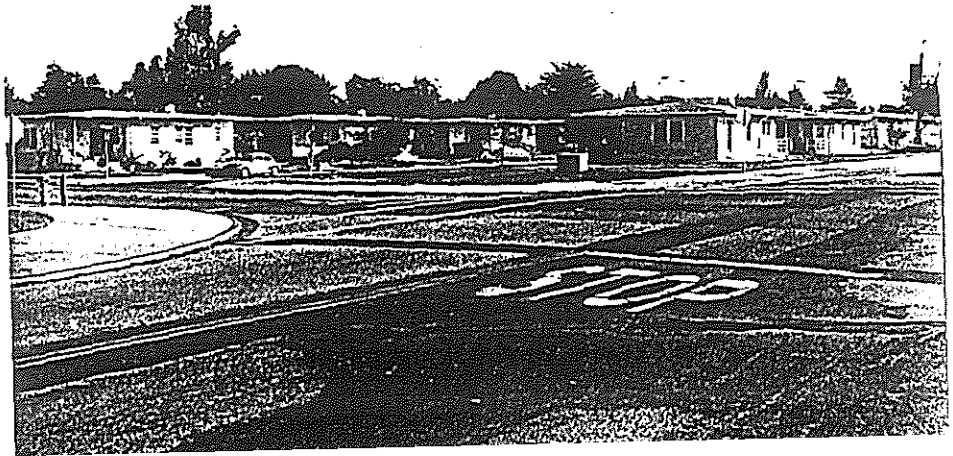
NAS ALAMEDA Senior Officer Housing











HISTORICAL INFORMATION

14. Construction date: 1941 Original location: yes
15. Alterations: none visible except for fencing around the type 2 houses.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District
Context formally developed: yes

19. Context: The officer housing contributes to the NAS Alameda Historic District under Criterion A because it was constructed in 1941 in an area adjacent to the central core at the end of Avenue A, a major cross-axis on the base that defines the northern edge of the district. Despite infilling with later housing, for the most part the area retains its historic character both in terms of the street pattern, landscaping, and architecture.
Under Criterion C, the two types of houses were designed in the simplified Modern style used in the permanent, non-residential buildings in the central core.

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

6. RESIDENTIAL AREA

6.1. Architectural Vocabulary of the Residential Area

The Residential Area includes more buildings than any other area: 29 one-story non-commissioned officers' (NCO) quarters and 18 two-story officers' quarters. Although large in numbers, the buildings within the Residential Area are easily managed because there are only two building types there.

The character of the residential area is defined as much by the landscaping and street layout as by the architecture of the buildings; the landscape is discussed in greater detail in Section 7. The landscape and the pleasant residences combine to create an area that resembles a pleasant suburban tract street. The homes are not in a Moderne or Streamline Moderne style, nor are they of any easily identifiable historical style. The officers' quarters do repeat some features found elsewhere, most noticeably in their windows. The NCO quarters are much more severe, although they do include the same window patterns found on the Officers' quarters. While it is unusual for the uniformity of the buildings there, the general character of the area is more similar to a post-war housing tract than to the remainder of the NAS Alameda Historic District.

6.2. Surface, Roof, and Building Form

Both the two-story officers' quarters and one-story NCO quarters are wood-frame buildings, sided in thick stucco on concrete foundations. The basic form of the officers' quarter building is shown in **Photograph 58**; the NCO quarters building is shown in **Photograph 59**.

The NCO residence includes a shallow hip roof with broad overhang. It includes a recessed porch, supported by a single wooden post.

The officers' quarters building is much larger and far more complex. The building includes a tall two-story, rectangular core with a nearly pyramidal hip roof, as well as one-story, flat-roofed wings to either side. The roofs are without overhangs. One side wing is a one-car attached garage, the other is a sun-room. The presence of an attached automobile garage is an unusual element for a home from the late 1930s.

The character-defining elements of the surface, roof, and building form include:

- Stucco surface.
- Hipped roof form; these are the only hipped roofs in the historic district, except for Building 94, the Chapel.
- Recessed porch on the NCO house.
- Two-story core with one-story wings form of the officers' quarters buildings.
- Attached garages in officers' quarters.

Design review considerations for these buildings include:

- These residential areas may prove difficult to manage, depending upon the re-use options, because the uniformity of design calls for uniformity of future modifications, if the intended character of the area is to be preserved.
- If the re-use calls for residential uses for the homes, some degree of flexibility in design review will be needed to accommodate personal tastes in such inherently personal matters as paint colors and interior room arrangements and equipment. Greatest attention should be paid to the uniformity of the facade, especially with respect to the "soft" features, particularly windows and doors. These will be discussed below.

6.3. Windows and Doors

The residential units within the NAS Alameda Historic District are remarkably unaltered. It appears that all, or nearly all, of the original windows and doors are still in place. The windows in both housing types are two-over-two double-hung wooden sash, consistent with the original window pattern throughout the Administrative Core. The windows in the officers' quarters are detailed in **Photograph 60.** A typical window in the NCO quarters is shown in **Photograph 61.** Virtually all of the front doors are also original, on both types of housing. In the officers' quarters, the front door is wooden with four wooden panels and four lights. In the NCO quarters, the front door is a five-panel wooden door with sidelights. In addition to the entry doors, the officers' quarters retain original, or at least very early, garage doors. A typical garage door is shown in **Photograph 62**.

Character-defining windows and doors include:

- Two-over-two double-hung wooden sash in both housing types.
- Original wooden and glass doors on officers' quarters; wooden doors with sidelights in NCO quarters.
- Original garage doors in officers' quarters.

Design review considerations for these windows and doors include:

- The uniformity of this residential area, as well as the charm of these residences, can be attributed to a very large degree to the presence of so many old windows there. Conversely, the character of the area would be diminished greatly, were these windows to be replaced.
- The original doors also contribute to the uniformity as well as to the charm of this residential enclave.

If the windows or doors must be replaced, the first option should be to replace in kind. The aluminum double-hung windows, which prove acceptable in the Administrative Core, would

likely not work as well on these smaller buildings. The warmth of wooden windows is an important and appealing part of these various homes.

6.4. Features and Elements

The NCO quarters are simple structures with few decorative elements or features. The character of these building is defined in their basic form as well as their clustering in a unified streetscape.

The officers' quarters, by contrast, are much more complex buildings. The core of these buildings from an architectural standpoint is the central entry. Several elements give focus to the central entry. One such element is an unusual solid porch support with porthole openings; it is shown in Photograph 56. Also shown in that photograph is a column of small windows that light the stairwell. Another notable feature, present on all officers' quarters in the area, are the original copper gutters and downspouts.

In summary, the notable architectural features of the Residential Area include:

- Solid porch supports with portholes, present on officers' quarters.
- Column of windows to light the staircases in the officers' quarters.
- Original copper gutters and downspouts.

Originally excluded from the 1992 Woodbridge report, Quarters A was added to the NAS Alameda Historic District in 1997. Quarters A is a contributing element of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. (See Continuation Sheet)

***P3a. Description (cont.):**

The main entrance of the two-story residential element is located on the north wall. This wall consists of a partial-width raised porch, with tiled steps and a cantilevered concrete flat roof. A canvas awning projects from the concrete porch roof. The porch is additionally sheltered on the west side by a concrete wall with three circular openings. The tile porch with stairs has a full length horizontal flower box. The five panel front door is flanked by five-light sidelights. Fenestration on this wall consists of four two-over-two double hung windows on the second story, a pair of two-over-two double-hung wood-sash windows and two stacked square fixed-pane wood windows on the first story. The east wall has a stuccoed chimney centrally located on the east side. The chimney is flanked by a pair of two-over-two windows on either side, and has a small two-over-two window to the north. Another two-over-two window is located on the first floor to the north **(Photograph 2)**. The first floor of the south wall has two pairs of three double hung-wood-sash windows.

The western section of the main house has a setback north wall with five two-over-two double-hung wood-sash windows on each of the first and second stories **(Photograph 3)**. A wide stucco chimney is located on the north end of the west wall, which lacks openings. A one-story sun porch projects from the west end of the western section. The north wall of the sun porch includes six five-light fixed wood windows **(Photograph 4)**. Two groups of four five-light fixed wood windows are located on the west wall **(Photograph 5)**.

The garage has two rollup doors on the northeast end and three small one-over-one double-hung wood-sash windows on the north side. A recessed porch spanning the north wall of the service wind is partially enclosed by a half wall with a set of concrete and tile stairs to the ground level. Fenestration includes three small one-over-one double-hung wood-sash windows and four pairs of two-over-two double-hung wood-sash windows as well as two doors.

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

In the construction of Naval facilities, housing did not become a common part of base planning until the influx of sailors in World War I. Previously, sailors were expected to live on ship, and few facilities were provided for enlisted men or even non-critical officers.[1] Shore housing for ship officers was not provided until 1899. The introduction of Naval Air Stations and other new facility types not tied to ships and shipyards required the inclusion of housing, as personnel could not be housed shipboard. Housing remained limited and senior officers charged with base operations had priority. Through the 1930s expenditures on base construction increased and the Bureau of Yards and Docks developed individual master plans for each new base. Quarters at these new bases were designed for the site reflecting the local style, climate and materials. Detached housing was preferred, and built to minimum standards set by the Department of Commerce. As World War II began the top grades of enlisted men were offered married housing, the policy was later expanded to all enlisted families.[2]

Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," June 2007, prepared for the United States Department of the Air Force and the United States Department of the Navy, 39.
[2] Kathryn R. Kuranda, R. Christopher Goodwin & Associates, Inc., "Housing an Air Force and a Navy: the Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949-1962)," June 2007, prepared for the United States Department of the Air Force and the United States Department of the Navy, 44, 45.

The northeast corner of NAS Alameda was developed for officers housing away from the main operations part of the Station. It was designed with a curvilinear street pattern rather than the straight lines of the main base to reflect a more suburban residential layout than military (Photograph 6).

Quarters A was designed by the Bureau of Yards and Docks and constructed in 1941 by Moore and Roberts of San Francisco.[3] As the quarters for the station commanding officer, Quarters A is separated from the other Officers' Housing by what is now W. Essex Drive and set back from the street with a curved driveway and is the largest of the 19 "Big Whites" measuring 3,098 square feet.[4] The house has been occupied by 30 station commanding officers most serving in that capacity for only two years, the longest tenure being four years.

Evaluation

Quarters A was built during the initial construction of the station, and was added as a contributing element of the NAS Alameda Historic District in 1997, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[5] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. The character-defining features of the residential buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[6] Though Quarters A had not been identified as a contributing element of the historic district in the 1997 guide, the character-defining features are the same as the residential buildings. These are detailed on the attached sheets, and include the stucco surface, hipped roof form, two story core with one story wings, attached garages, two-over-two double-hung wooden sash windows, remaining original garage doors, porch supports with circular cut outs, and remaining original copper gutters and downspouts.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Quarters A, therefore, does not meet the criteria for listing in the NRHP or CRHR within the

context of the Cold War because it does not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1). As no significant events or trends began on NAS Alameda during the Cold War, commanding officers were not associated with significant events, but with daily support operations of the station. In this aspect they are not differentiated from other installation commanding officers. Individual officers may have gone on to make significant contributions to Naval activities or had illustrious careers before coming to NAS Alameda, but the residence on NAS Alameda is not associated with this productive period of their lives and is therefore not significant under NRHP Criterion B / CRHR Criterion 2. The building does not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor is it likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although it does not possess Cold War-era significance, this building remains a contributing element of the NAS Alameda Historic District (NRHP Status Code 2D2).

DESCRIPTION
6. Property category: District Number of resources documented: 85

30

7. Existing condition: There are two types of houses: the first type, of which there are 29 aligned in rows on either side of the street north of Ave. C, are one-story, wood-frame, stuccoed houses with flat roofs and rectangular plans. A recessed entrance porch, raised on three steps and supported with one wood post is located at one end of the building; service porches are located in back. The doors are wood with one light; typical windows are four-light wooden hopper sash in wood frames. The houses have minimal foundation planting and a concrete sidewalk that extends to the street. The rows of houses face the street and have shared back yards.

19

The second type, of which there are 18, is a two-story, wood-frame, stuccoed house with a one-story wing on one side and a garage on the other. The main part of the house has a hip-roof; the wing and garage have flat roofs. The houses have stylistic features representative of the early Modern style such as a vertical row of small, square windows in the center of the facade that light the stairwell and entrance porches raised three steps that have one wall with three round openings and two square windows near the wood and glass entrance door. Wooden planters wall the edge of the porch. Typical windows have wooden hopper sash with two-over-two lights in wood frames. The garage doors are paneled wood with four lights across the top. Most of the houses have acquired fenced yards since they were built; they are evenly spaced on curving streets that set
the area apart as a residential development. They are landscaped with foundation shrubbery and mature palms and other trees. Newer housing has been built on peripheral land.

6. RESIDENTIAL AREA

6.1. Architectural Vocabulary of the Residential Area

The Residential Area includes more buildings than any other area: 29 one-story non-commissioned officers' (NCO) quarters and 18 two-story officers' quarters. Although large in numbers, the buildings within the Residential Area are easily managed because there are only two building types there.

The character of the residential area is defined as much by the landscaping and street layout as by the architecture of the buildings; the landscape is discussed in greater detail in Section 7. The landscape and the pleasant residences combine to create an area that resembles a pleasant suburban tract street. The homes are not in a Moderne or Streamline Moderne style, nor are they of any easily identifiable historical style. The officers' quarters do repeat some features found elsewhere, most noticeably in their windows. The NCO quarters are much more severe, although they do include the same window patterns found on the Officers' quarters. While it is unusual for the uniformity of the buildings there, the general character of the area is more similar to a post-war housing tract than to the remainder of the NAS Alameda Historic District.

6.2. Surface, Roof, and Building Form

Both the two-story officers' quarters and one-story NCO quarters are wood-frame buildings, sided in thick stucco on concrete foundations. The basic form of the officers' quarter building is shown in **Photograph 58**; the NCO quarters building is shown in **Photograph 59**.

The NCO residence includes a shallow hip roof with broad overhang. It includes a recessed porch, supported by a single wooden post.

The officers' quarters building is much larger and far more complex. The building includes a tall two-story, rectangular core with a nearly pyramidal hip roof, as well as one-story, flat-roofed wings to either side. The roofs are without overhangs. One side wing is a one-car attached garage, the other is a sun-room. The presence of an attached automobile garage is an unusual element for a home from the late 1930s.

The character-defining elements of the surface, roof, and building form include:

- Stucco surface.
- Hipped roof form; these are the only hipped roofs in the historic district, except for Building 94, the Chapel.
- Recessed porch on the NCO house.
- Two-story core with one-story wings form of the officers' quarters buildings.
- Attached garages in officers' quarters.

Design review considerations for these buildings include:

- These residential areas may prove difficult to manage, depending upon the re-use options, because the uniformity of design calls for uniformity of future modifications, if the intended character of the area is to be preserved.
- If the re-use calls for residential uses for the homes, some degree of flexibility in design review will be needed to accommodate personal tastes in such inherently personal matters as paint colors and interior room arrangements and equipment. Greatest attention should be paid to the uniformity of the facade, especially with respect to the "soft" features, particularly windows and doors. These will be discussed below.

6.3. Windows and Doors

The residential units within the NAS Alameda Historic District are remarkably unaltered. It appears that all, or nearly all, of the original windows and doors are still in place. The windows in both housing types are two-over-two double-hung wooden sash, consistent with the original window pattern throughout the Administrative Core. The windows in the officers' quarters are detailed in **Photograph 60.** A typical window in the NCO quarters is shown in **Photograph 61.** Virtually all of the front doors are also original, on both types of housing. In the officers' quarters, the front door is wooden with four wooden panels and four lights. In the NCO quarters, the front door is a five-panel wooden door with sidelights. In addition to the entry doors, the officers' quarters retain original, or at least very early, garage doors. A typical garage door is shown in **Photograph 62**.

Character-defining windows and doors include:

- Two-over-two double-hung wooden sash in both housing types.
- Original wooden and glass doors on officers' quarters; wooden doors with sidelights in NCO quarters.
- Original garage doors in officers' quarters.

Design review considerations for these windows and doors include:

- The uniformity of this residential area, as well as the charm of these residences, can be attributed to a very large degree to the presence of so many old windows there. Conversely, the character of the area would be diminished greatly, were these windows to be replaced.
- The original doors also contribute to the uniformity as well as to the charm of this residential enclave.

If the windows or doors must be replaced, the first option should be to replace in kind. The aluminum double-hung windows, which prove acceptable in the Administrative Core, would

likely not work as well on these smaller buildings. The warmth of wooden windows is an important and appealing part of these various homes.

6.4. Features and Elements

The NCO quarters are simple structures with few decorative elements or features. The character of these building is defined in their basic form as well as their clustering in a unified streetscape.

The officers' quarters, by contrast, are much more complex buildings. The core of these buildings from an architectural standpoint is the central entry. Several elements give focus to the central entry. One such element is an unusual solid porch support with porthole openings; it is shown in Photograph 56. Also shown in that photograph is a column of small windows that light the stairwell. Another notable feature, present on all officers' quarters in the area, are the original copper gutters and downspouts.

In summary, the notable architectural features of the Residential Area include:

- Solid porch supports with portholes, present on officers' quarters.
- Column of windows to light the staircases in the officers' quarters.
- Original copper gutters and downspouts.

***Recorded by:** C. Brookshear and S. Miltenberger ***Date:** September 30, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of these buildings by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). They are contributing elements of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and has a NRHP status code of 2D2.

P1. Other Identifier: Building 20, 21, 22, and 23

P2 e. Other Locational Data: 2701 Monarch Street, 2601 Monarch Street, 2501 Monarch Street; on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 20, 21, 22, and 23 are landplane hangars of identical design. The description that immediately follows refers to all four landplane hangars.

The landplane hangars have a roughly square floor plan measuring 254 feet by 213 feet with a low-pitched gable roof and range from 65,547 to 67,344 square feet. Both the north and south facades are almost entirely made up of sliding hangar doors. Each hangar door is comprised largely of windows, being sets of three-over-four industrial sash above a solid bottom panel with inset personnel doors. Each corner of the building has broad, rectangular corner piers with decorative horizontal bands running from pier to pier across the façade. The piers are offset from the façade and a shed roof extends from pier to pier to shelter the hangar doors **(Photographs 1 and 2)**.

The east and west sides have two rows of three-over-four and four-over-four industrial sash windows with a combination of hopper and awning windows. Above is a set-back third story with windows, and on the roof two clerestories. At ground level are several metal and wood personnel doors, some with six-light windows and others with single-light **(Photographs 3 and 4)**.

B10. Significance:

This update form was prepared to provide additional information about the Landplane Hangars, assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 20, 21, 22 and 23 were all constructed as landplane maintenance hangars in 1941 by Robert E. McKee of Los Angeles **(Photograph 5)**. In the 1940s, Hangar 23 housed the Aircraft Preservation Shop, Flight Test Shop, and Radio-Radar Installation Shop. Planes were brought to the hangar upon completion of overhauls or repairs, for the installation of radio and radar equipment, and for flight test preparation. The Non-Operational Aircraft Movement

Office, which was responsible for parking and moving all airplanes in the custody of the A&R Department, was also housed in Hangar 23.[2]

The Utility Squadron was also quartered in Hangar 23. The mission of the squadron was to provide transportation for the Twelfth Naval District and station personnel on Naval missions to West Coast bases. Other duties included tow-target work for the anti-aircraft gunnery, caring for transient planes, and meeting important persons arriving to the Station by air. The squadron was also responsible for visitor's automotive transportation and care of their planes. Between the 1940s and the late 1960s, the Utility Squadron was renamed the Operations Maintenance Division (OMD) and moved from Hangar 39 to Hangar 23. Transient Line personnel were also moved to Hangar 23 from Building 19 to consolidate all transient services in one location.[3]

In 1968 Congress passed *The Reserve Forces Bill of Rights and Vitalization Act on 1968,* reorganized the Naval Air Reserve to be organized, equipped, and manned the same way as active duty squadrons. The Naval Air Reserve Unit (NARU), also called Naval Air Reserve Training Unit (NARTU), on NAS Alameda--also known as the "Weekend Warriors"-- was primarily based out of Hangars 20 and 22. NARU/NARTU trained 3,000 reservist and was the nations largest single active Reserve in the late 1960s and early 1970s. The majority of "Weekend Warriors" were trained Naval Aviation veterans from World War II, Korea, and the Vietnam War. NARU had eight tactical and sixteen non-tactical units located at the Station. In the late 1970s, the Aero Club, a flight instruction and recreation flying group, was located on the second floor of Hangar 20. Membership was restricted to full time civilian Department of Defense employees and reserve military personnel.[4]

In 1980 the Operations Maintenance Division was replaced by the new Field Services Division (FSD) located in Hangar 23. FSD had the same responsibilities of OMD to provide support to the Transient Fleet Aircraft such as fueling; engine, oxygen, and nitrogen service; and major assistance of loading and unloading aircraft aboard ships home ported at NAS Alameda.[5]

From the 1970s to 1990s, Hangars 20-23 housed various reserve units. Starting in January 1989, Hangar 20 housed the Helicopter Mine Countermeasures Squadron 19 (HM-19), which increased the airborne mine hunting capacity of the U.S. Navy by 20 percent. With approximately 200 reservists and active personnel, the mission of the squadron

was to counter the threat of mine warfare. The squadron was the first on the West Coast and the Naval Reserves second HM squadron. Hangar 21 housed Attack Squadron 304 (VA-304), which was commissioned on NAS Alameda in 1970, and was under the control of Carrier Air Wing Reserve 30. Composed of reservists and active military personnel, the mission of the squadron mirrored the active-duty fleet squadron with training for all phases of combat weapons, delivery tactics, and carrier qualifications.[6]

The Marine Aircraft Group 46 Detachment B (MAG-46 Det B), was the only Marine Corp Aviation Unit in Northern California and located in Hangar 22. Its mission was to provide training and support to Marine Corp Reservists for HMH-772 Det A, MALS-46 Det B, MWSS-472 Det A squadrons. Previously known as the Marine Aircraft Group 42, the detachment was commission on NAS North Island, San Diego in 1943, transferred to NAS Alameda in 1961 and re-designated in 1992.[7]

Hangar 23 housed Helicopter Squadron 85 (HS-85), known as the "Golden Gaters" which was commissioned in 1970 at NAS Alameda. The mission of the squadron was to seek and destroy enemy submarines, and search and rescue in support of the Carrier Battle Group. HS-85 regularly deployed reservist on active-duty carriers as part of the Reserve Carrier Air Wing to participate in anti-submarine warfare and search and rescue exercises at various West Coast facilities. The rotating beacon structural tower and platform on the roof of Hangar 23 was constructed in 1992.[8]

Evaluation

Buildings 20, 21, 22 and 23 were built during the initial construction of the station, and are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[9] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[10] These are detailed on the attached sheets, and include smooth stucco surfaces above a tall concrete base, prominent pylon-like door pockets integrated into the structure, rooftop monitors, grand interior spaces with offices along the sides, immense glazed segmental hangar doors, steel industrial sash with awning openings, steel personnel doors with transoms, copper flashing and roofing, and a decorative band above hangar doors and around door pockets.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic

nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[11] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 20, 21, 22 and 23, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). Buildings 20, 21, 22 and 23 do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Buildings 20, 21, 22 and 23 do not individually, nor as a group, possess Cold War-era significance, these buildings remain contributing elements of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.&2. Historic/Current name: Buildings 20, 21, 22, 23, 11-400-12, and 39, 40, 41,
Aircraft Maintenance Hangars.
3. Locations: Hangars 20-23: First St.; Hangars 11-400-12 and 39-41: Ave. F
NAS Alameda Map J-M-19, P-21-26 City: Alameda Zip: 94501 County: Alameda Code:001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: Two-story, concrete structures with metal frames and roof trusses that define a bowed roof concealed behind roof parapets. The hangars have rectangular plans and were built in two sizes: Hangars 20-23 are 254 ft. by 213 ft. by 40 ft. high; Hangars 11, 12, and 39-41 are 321 ft. by 242 ft. by 50 ft. high. Large, rectangular corner piers rising to the height of the parapet enframe the ends of the buildings. The piers are off-set from the facade and a metal shed-roof extends across the wall to shelter the sliding metal hangar doors which have solid lower sections and glazed, multiple-light upper sections. The eaves of the shed-roof are tied visually to the corner piers by a scored band around the piers. The other building elevations are stepped back above the second stories. Below the set-back, the walls are fenestrated with bands of metal-framed windows with 12-light sash on the upper story and, on the lower story, continuous metal-framed doors and windows that also form a complementary band. The tops of the walls are capped with dark bands as are the piers.

8. Planning Agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11.Present use: military base
12. Zoning: none

HISTORICAL INFORMATION

14. Construction dates: Hangars 11, 12, 20-23, and 40 - 1941; Hangar 39 - 1944;
Hangar 41 - 1945 Original location: yes
15. Alterations: The area between Hangars 11 and 12 was infilled with Building 400 in the postwar period. The other hangars appear unaltered.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic Attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally
developed: yes

19. Context: With the exception of Hangars 11 and 12, which have lost integrity because of infill construction, the aircraft hangars contribute to the NAS Alameda Historic District under Criteria A because they were constructed during the period of significance as part of the central core and, for the most part, strongly enforce the impression of the naval air station as an historic setting. Architecturally, under Criterion C, these are handsome structures that exhibit the stylistic traits of the early Modern style of the period in their cubistic forms, unifying detail such as the banding of openings and the scored lines on the piers, and fenestration.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C

4. HANGARS AREA

4.1. Architectural Vocabulary of Buildings in the Hangars Area

The Hangars Area is of obvious historical importance to the NAS Alameda, which operated as an air station for more than half a century. The hangars are also among the most imposing structures within the historic district, with each building looming large and the rows of hangars creating dramatic vistas. **Photograph 35** shows the vista created by Buildings 77, 39, 40, and 41. **Photograph 36** shows the equally dramatic vista from the hangars to San Francisco Bay. The Hangars Area includes Buildings 20, 21, 22, 23, 39, 40, 41, and 77. The area exists on two sides of the historic district, facing First Street to the east and Avenue F to the north.

Although it is the most imposing area from the structural standpoint, it is a much less complex area from the design review standpoint because the buildings are nearly all the same. The seven hangars -- Buildings 20, 21, 22, 23, 39, 40, and 41 -- are essentially identical. Building 77, the passenger terminal is unique.

4.2. Surface Materials, Basic Building Forms

The seven hangars are large, steel framed buildings, surfaced in thick stucco with tall concrete foundations, or bulkheads. At the two ends of each building, the "walls" are taken up almost entirely by the hangar doors, along with the pockets for those doors at either side. These large pockets are like pylons in their sculptural form. On the side elevations, the door pocket pylons flank a two-story band of office and shop space. The hangar buildings include shed-roofed light monitors on the rooftop. The basic shape of the end wall is shown in Photograph 34; the shape of the side office wing is shown in **Photograph 37**.

Although massive, the seven hangars are rather simple buildings, from the structural as well as the architectural standpoint. In terms of the basic structure, the character-defining elements include:

- Smooth stucco surface above a tall concrete bulkhead.
- Prominent pylon-like door pockets, integrated into the structure (these door pockets are often freestanding).
- Rooftop monitors.
- Grand interior hangar spaces with office wings to either side.

The design review considerations for the basic form of the hangars include the following:

- Respecting the exterior appearance while providing maximum flexibility in the re-use of the hangar spaces. It is nearly inevitable that the huge hangar spaces will need to be subdivided for re-use. In terms of the visual contribution of these buildings, the subdivision of those interior spaces should have little or no effect on the historic district as a whole.
- Respect for the exterior appearance includes discouraging construction of additions.

Building 77 is in the Hangars Area but is a much different building type. Because it was a gateway building -- a building frequented by the visiting public -- Building 77 was treated architecturally as if it were part of the Administrative Core. The front of the building -- the elevation meant for public enjoyment -- faces the taxiway. At this elevation, Building 77 is a very Moderne structure, with curved surfaces leading to the central entry, as shown in **Photograph 38.** The entry includes a wide concrete stairway. The rear (north elevation) of the building faces the Shops Area and is much more utilitarian in design. The rear and side elevations are shown in **Photograph 39**.

Character-defining elements of Building 77 include:

- Smooth concrete surface.
- curving entry composition.
- Wide ceremonial entry stairs.

As discussed in the introduction, Building 77 was modified to include third story wings and single-pane, picture windows at the facade. This type of addition and window modification is instructive with respect to the types of modifications that should be discouraged under the design review process. The addition, one of few in the historic district, matches the curvature of the original but introduces a new material (plywood) which is not consistent with the reinforced concrete design of this building and of the historic district generally.

4.3. Windows and Doors

The key doors at the hangars are the massive hangar doors at either end. These doors, typical of aircraft repair hangar doors from the period, appear to be entirely original and also operational. These doors should be regarded as the most important elements of the seven hangars and largely irreplaceable.

Smaller windows and doors are found on the side office wings, behind the hangar door pockets. The two-story office wings include two wide bands of steel industrial sash. The steel industrial sash generally includes 16 panes in each panel, four of which open in an awning manner. In nearly all cases, the original steel industrial sash appear to be in place and operational. **Photograph 40** shows the steel industrial sash on the second story of the east side of Building 20. Building 20 is currently in use. It will be observed that many of the windows shown in that photograph have been opened, indicating the windows are operable. Retaining operational windows is a key consideration in maintaining historic buildings in an area with the climate of Alameda Island, in which windows may be opened virtually year around.

The side office wings of the hangars also include many original steel personnel doors, two of which are illustrated in **Photograph 41**. The original steel doors included steel transoms. In

many instances, these transoms have been blocked off or otherwise modified, as shown in this photograph. While minor in relation to the scale of the building, this type of modification should be discouraged during the design review process.

Building 77, although a much different type of building, includes windows and doors that are typical of the Hangars Area, including awning-type steel industrial sash. These windows are set in elegant bands at the facade, as shown in Photographs 1 and 36. Building 77 also includes steel personnel doors, similar to those used in the hangars. The windows at the facade of this building have been modified, as discussed.

The character-defining windows and doors in the Hangar Area include:
- Immense glazed segmental hangar doors.
- Steel industrial sash with awning-type openings.
- Steel personnel doors with transoms.

Design review considerations for these windows and doors include:

- The hangar doors should be regarded as irreplaceable. These should be repaired rather than replaced.
- The hangar doors should be retained, even if they must be fixed in place.
- The steel industrial sash is very difficult to replace because few companies still manufacture it. Barring emergencies, this very durable window material should be repaired rather than replaced.
- If it must be replaced, this sash should be replaced in kind. The complex window patterns and industrial appearance cannot be replicated with fixed "picture window" type sash. The clumsy effect of this type of window can be seen in Photograph 1.

The good news from a design review standpoint is that it is demonstrably possible for the hangar buildings to be re-used without damage to the character-defining windows and doors. Building 20 was being re-used at the time this report was prepared. The side windows and doors were being used as intended, as were the hangar doors, which provide convenient access to industrial areas. The "soft" elements of these buildings are apparently quite durable and have been maintained well. The office windows, for example, all appear to be operational and are being used.

4.4. Features and Elements

The character of the buildings in the Hangars Area is defined by the strictly utilitarian approach to their design. There are few features or elements that were added to these buildings strictly for the sake of architectural embellishment. The buildings were built for heavy use and are largely devoid of applied decorative elements.

Nonetheless, some of the utilitarian elements of the buildings are noteworthy. A surprising aspect of the buildings was the extensive use of copper flashing. This copper, now aged to its

natural green patina, exists on the pent roof over the hangar doors and on the parapet of the door pockets and on the sides of the office wings. This copper is almost completely intact. In a few instances, however, the copper roofing over the hangar doors has been replaced or covered with a composition shingle roofing material, which detracts from the appearance of the building. This is true, for example, with the pent roof over the hangar doors of Building 41.

In addition, the hangar buildings include a decorative band on the door pockets and across the face of the hangar door ends, defining the bottom of the pent roof over the hangar doors.

In summary, the character -defining features and elements are few but include:

- Copper flashing and roofing.
- Decorative band at the fascia of hangar door pockets and above hangar doors.

Design review considerations are relatively few as well:

- The copper flashing is a very durable material and expensive to replace. It should be repaired rather than replaced, unless shown to be beyond repair. If replaced, it should be in copper in the geometry of the original.

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). These buildings are contributing elements of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and have a NRHP status code of 2D2.

P1. Other Identifier: Buildings 30 and 31

P2 e. Other Locational Data: 2900 Navy Way on former NAS Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 30, the Main Gatehouse, is an L-shaped building on a concrete foundation with a flat roof with a total of 5,196 square feet (**Photograph 1**). The long wing of the "L" is oriented along a roughly east-west axis; the short wing is oriented along a north-south axis. The long wing is one story, while the short wing is two stories. Along the north and east sides of the building runs a concrete canopy roof supported by oval columns.

The roof covers a rounded front porch area. A wooden bench with decorative horizontal bands runs along the front porch area. There are two-over- two double-hung windows throughout the building's first story. On the second story are six tall windows – three on the west side and three on the east side. A stylized American bald eagle with an American flag shield adorns the north side of the second story.

Building 31, the Sentry House, is an ovoid-shaped, one-story, concrete 164 square-foot building. It has a flat concrete canopy roof with a three-foot overhang (**Photograph 1**). A continuous band of windows facing northward fronts the building. Below the windows "United States Naval Air Station Alameda" is written out. Metal gates with decorative horizontal bands and curved lines which mimic the lines of the Moderne building (**Photograph 2**), fold along the east side and along the west side (nearest Building 30) of Building 31; two concrete bunkers lay in front. To the rear (south) of the Sentry House are two boarded doors and three additional windows.

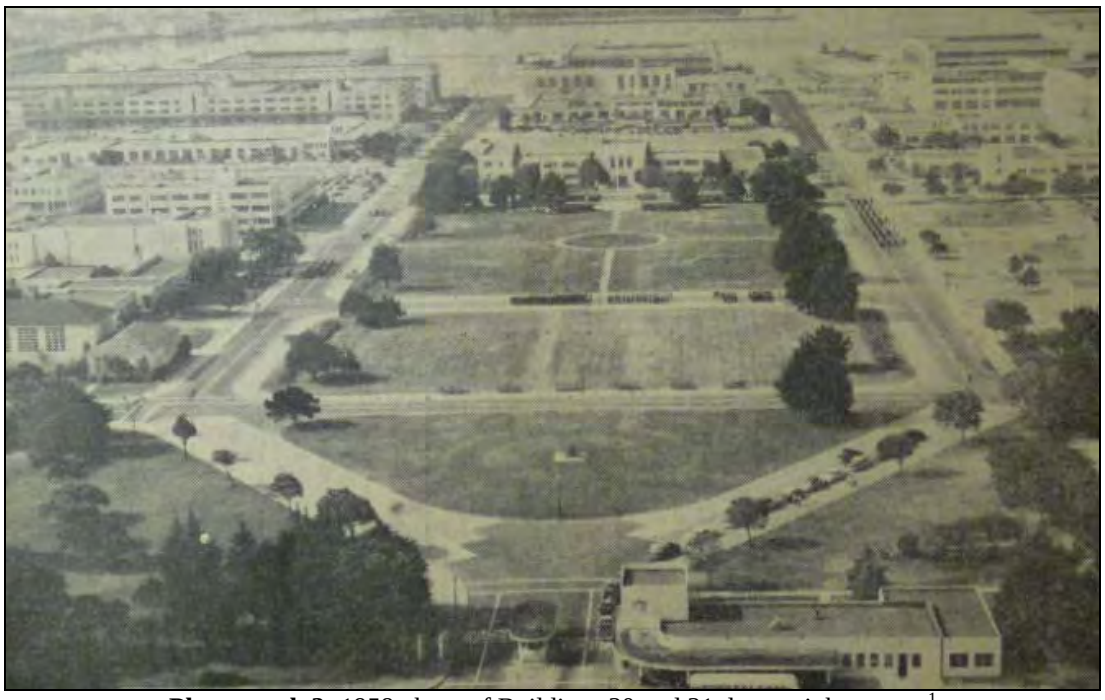

Photograph 3: 1958 photo of Buildings 30 and 31, lower right corner.[1]

B10. Significance:

This update form was prepared to provide additional information about Buildings 30 and 31, to assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 30 and 31 are located where the Alameda Municipal Airport Building was located prior to the construction of the station. Both buildings were constructed in 1941 by contractor Moore and Roberts of San Francisco as permanent structures. Building 30 was built as a gatehouse building with an 'L' shaped addition in 1942 at the west end **(Photograph 3)** and Building 31 was constructed as a sentry house. Building 30 was used primarily for security,

[1] "NAS Alameda 'Open House' Attracts Record Crowds," *The Carrier,* 23 May 1958.

police escort, finger printing, police pass and as a traffic booth. The Employment Division Placement Action Section relocated from Building 30 to Building 183 in 1949.[2]

During the Cold War, the mission of the Security Department was to provide protection for NAS Alameda and all government property located there from fire, invasion, espionage, sabotage, subversive activities, and other criminal acts. The department screened people entering the Station, issued identification cards, controlled traffic, and provided guards for classified materials if necessary. Civilian guards from the Overhaul and Repair Department, now NARF, were under the command of the Security Department as well.[3]

In the early 1980s new drug detection/guard dog kennels were constructed at the west side of Building 30. The Narcotic/Drug Detector Dog Team served the Station, all tenant activities, and Department of Defense installations in the Bay Area and Northern California. The team also worked with the U.S. Customs Service and civilian law enforcement agencies.[4]

Evaluation

Buildings 30 and 31 were built during the initial construction of the station, and are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[5] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[6] These are detailed on the attached sheets, and include smooth concrete surfaces of the buildings, horizontal orientation, flat roofs, emphasizing vertical elements, curved contrasting elements, original and sympathetic two over two windows, oval columns along the arcade, and cast stone eagle and flag figure on Building 30. The dominant vertical element is the two story tower on the eastern end of Building 30 with vertical window recesses. Curvilinear roof overhangs are prominent on both buildings providing the contrasting elements. Additional character-defining features of the buildings are the original metal vehicle and pedestrian gates which mimic the horizontal and curvilinear Moderne elements of the buildings.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic

nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[7] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 30 and 31, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Buildings 30 and 31 do not individually, nor as a group, possess Cold War-era significance, the buildings remain contributing elements of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Buildings 30 and 31, Main Gatehouse and Sentryhouse.
3. Street: Main Gate **NAS Alameda Map** I-23,24 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: Building 30 is a one- and two-story concrete building with a flat roof and a U plan. The two-story section faces the sentry house, Bldg. 31, across the entrance road. Bldg. 30 has a concrete canopy extending from the E side, a variety of metal- and wood-framed windows, and wooden entrance doors on all sides of the building. The sentry house, #31, is a small concrete structure, 21 ft. by 9 ft. by 10 ft., with a flat concrete roof that extends to form broad overhangs. Doors and windows are the same type as in Bldg. 30.

HISTORICAL INFORMATION
14. Construction date: 1941 Original location: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION
18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda. Period: 1938-1945 Property type: District Context formally developed: yes

19. Context: Buildings 30 and 31 contribute to the NAS Alameda Historic District under Criterion A because they were constructed in 1941 as part of the early core of the base and continue in their original function. Under Criterion C, the buildings contribute because they were designed in the simplified Modern style of the rest of the core buildings on the base and remain unaltered.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

3.7. Character-Defining Elements of Building 30 and 31.

Buildings 30 and 31 were literally "gateway" buildings for the NAS Alameda and, for this reason, were given a degree of attention not commonly found in utilitarian buildings of this sort. The two buildings, along with the original gate posts to the east, were clearly designed as a group and are consistent with the design theme for the historic district. Building 30 is shown in **Photograph 33**. Among the character-defining elements are:

- Smooth concrete surface.
- Flat roofs with broad, sweeping concrete canopies.
- Characteristic oval columns, supporting the broad canopy.
- Sympathetic aluminum two-over-two double-hung sash.
- Cast stone eagle and flag figure on Building 30.

3.8. Character-Defining Elements of Building 60.

Building 60 -- the Officers' Club -- is the most heavily modified building within the historic district. The building offers strong evidence of the impact of replacement of the impermanent parts of a building, chiefly its windows and doors. While the basic form of this handsome building remains, the loss of the original windows and doors diminishes its architectural and historical importance. It now has a frankly modern overall appearance, owing to the replacement of the "soft" elements. Key character-defining elements include:

- Rounded main room at the facade, shown in **Photograph 34.**
- A few remnant original windows, including stacked windows in the rear patio area and to one side of the facade.

3.9. Character-Defining Elements of Building 94.

Building 94, the Chapel for NAS Alameda, was built during the middle of World War II, when concrete was scarce. Although a highly prominent building, it was built of wood, with a flush horizontal board siding, probably with a shiplap joint. This wooden siding appears to be in excellent condition. It was also fitted with a series of hipped roofs, also unique within the Administrative Core and within the historic district generally, except for the quarters, which also have hip roofs. Among the key character-defining elements for this building are:

- Board siding.
- Original double-hung, two-over-two windows on the north wall.
- Art glass windows in the chapel area.
- Stacked openings in the belfry.

Page 1 **of** 11 ***Resource Name or #** (Assigned by recorder) Mess Hall and Galley

***Recorded by:** S. Miltenberger and H. Norby ***Date:** October 6, 2009 ☐ **Continuation** ☒ **Update**

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). Buildings 3 and 63 are contributing elements of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and have a NRHP status code of 2D2.

P1. Other Identifier: Buildings 3 and 63

P2e. Other Locational Data: 2651 Lexington Street on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Mess Hall / Galley (Building 3), constructed in 1940, contains 55,327 square feet. The complex building varies between one and two stories with flat roofs surrounded by parapets. The poured concrete building consists of a two story mess hall (Mess Hall 1) across the front (east façade). One-story Mess Halls 2 and 3 form wings at a right angle to Mess Hall 1 along the north and south sides. The one-story galley fills the area between the mess halls, and a center food storage wing projects westward from the galley. Additions to the food storage wing and set-backs along the western side of the galley create a complex western elevation.

The main façade (east) forms the end of the courtyard formed by Buildings 2, 3 and 4 and is connected to the other buildings through a curved one story colonnade. The front of Mess Hall 1 is flush with the front of the colonnade **(Photograph 1)**. Mess Hall 1 consists of nine bays. The end bays are solid creating two end pilasters with stylized eagle statues at the outer corner of each. Three small lights are arranged vertically at the second floor level of each pilaster. Six oval concrete columns support a plain entablature over a open two story porch. Each bay contains a set of three windows on each story, truncated to two windows at the end bays. The second story windows are two-over-two fixed in metal frames. The first floor windows are taller with a third, two-light sash added to the bottom. In the center bay is the main entrance slightly recessed with curving sides **(Photograph 2)**. The central pair of doors and flanking single doors are boarded over, as are the transoms above. Above the door openings is a painted arch and the words "Welcome Aboard N.A.S. Alameda." Mess Halls 2 and 3 are set behind the curving colonnade. The end of each mess hall is three bays. Two bays contain pairs of windows and the third a pair of doors. Eagle statues flank the façade of the mess hall **(Photograph 3)**.

The sides of the building are simple. The south side of Mess Hall 2 has six sets of three, two-over-two windows spaced evenly in a row at the center of the elevation. The north side of Mess Hall 3 had similarly sized windows of which only three remain, the others have been covered or filled **(Photograph 4).**

The west side is complex because Mess Halls 2 and 3, adjoining Y JF, and galley create a series of set-backs. The food storage wing then projects from the center of the galley, additions to the sides of the food storage wing has created an open narrow passage between the food storage wing and the mess halls which leads to the galley. Another addition in 1957 to the west connects Building 3 with Building 63. The west ends of the two mess halls have two sets of windows and a doorway. Both doorways are reached by a stair with curving retaining wall at right angles to the mess hall. Above the stoop is a cantilevered flat roof with curved edges. Mess Hall 2 has a pair of doors and Mess Hall 3 has a single door **(Photographs 4 and 5)**. The small sculleries in the corners between the galley and the mess halls have a single group of three windows and door reached by a concrete stoop, with poured concrete side walls.

The food storage wing has a loading dock along its west side **(Photograph 6)**. A wide entry is centrally located and in a recess with angled walls. Single two-over-two windows are located on either side of the central doorway. Three doors are located to the south and two doors to the north. A horizontal wood sided addition is located to the south.

This addition has a row of fixed windows and three doorways **(Photograph 7)**. North of the recessed central doorway is a 1957 addition which connects Building 3 and Building 63. Breezeways separate the addition from Building 3 and Building 63. The north half of the addition is concrete with a flat roof, it has an overhead delivery door and large vent on the north side. The south half is sheathed in horizontal wood siding hand has a gable roof. A single sliding door is located on the south side.

The interior of Building 3 has been significantly altered since its original construction. Lowered ceilings are now found throughout the building, and the upstairs dropped ceilings cover most of the original light wells **(Photograph 8)**. Newer additions to the building include half-wall partitions, such as those dividing the mess hall areas **(Photograph 9)**. However, the building retains some original architectural features. Similar to Buildings 2 and 4, Building 3 has "mushroom" style concrete supports throughout the building, specifically noted in the kitchen and some of the larger open rooms **(Photograph 10)**. Additionally, lighting within Building 3 is a mixture of differing fixtures, some of which may be remnants from the original installation. Character-defining features within Building 3 include the curved stairwells and their metal handrails **(Photograph 11)** and the original light wells noted on the second floor.

Building 63 has a rectangular plan on a concrete foundation supporting wood panel-formed concrete and a flat roof **(Photographs 12, 13)**. Fenestration includes seven, eight-light windows on the south side and one, 16-light window on the east and west sides. The west side has three, eight-light windows on the north, two boarded-up windows, double metal personnel doors with a boarded-up transom, and two other metal personnel doors. Building 193 connects to Building 63 on the east side and Building 3 on the north side. A cantilevered flat concrete roof projects off the north side of the building to Building 3, which creates a breezeway between the two. A set of concrete stairs and asphalt ramp lead up to the elevated breezeway area.

B10. Significance:

This update form was prepared to provide additional information about Buildings 3 and 63, to assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Building 3, the Mess Hall / Galley, was part of the original base plans from 1939. Contractors Johnson, Drake, and Piper built the building and completed it by 1940 for a cost of $1,758,292. It was primarily a mess hall and galley along with an enlisted men's barracks. In 1940, the dining capacity of Building 3 was 4,908. In 1942, the same contractors built Building 63 for $55,277. It provided additional kitchen facilities including a bakery.[1]

[1] Administration, Pacific Region, (San Francisco); Command History 1971, Box 2 of 2, 5757-1b, Naval Air Station Command History, 30 Volumes, 1968-1997, Record Group 181, US Naval Shore Facilities, National Archives and Records Administration,

Building 3 was one of many eateries on base, but was restricted to military personnel, specifically enlisted men. In 1957, Building 3 was modified with the addition of a pots and pans room within the building's galley area and an addition to the west side which connected Building 3 with Building 63. In 1961, NAS Alameda became one of the largest Naval Air Reserve Training Units (NARTU) in the nation and this resulted in the barracks portion of Building 3 becoming NARTU berthing areas. By 1972, these areas required renovation, which resulted in the construction of nine, four-men rooms and one three-men room. The Seabees (CBU-409) and Self Help carried out these renovations along with similar alterations conducted in the enlisted men's barracks in Buildings 2 and 4.[2]

Additional 1970s renovations of Building 3 included the remodeling of the recreation center, improvements to the galley, and the creation of the "Rope Yarn," which was a food and drink facility that also provided recreational activities. In 1974 most of the doors were replaced, along with the consolidation of the Petty Officers' Mess and Enlisted Mess which became the Enlisted Mess (Open). This consolidation of title also came with extensive interior renovations including new furnishings, flooring, lighting and the creation of a game room on the second floor. An older television lounge was also converted into offices at this time. The entire renovation was completed by the Seabee/Self Help program with a personnel loan of $69,000. Additional improvements to Building 3 were made in 1989 with the conversion of steam heat to hot water, and Building 63 was partially reroofed in 1995. The following year the NAS Galley was relocated from Building 3 to smaller facilities in Building 4.[3]

Evaluation

Buildings 3 and 63 were built during the initial construction of the station, and both are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[4] The contributing elements of the district each retain adequate

historic integrity to that period to convey their historic significance. In addition to the architectural significance recorded by the previous studies (attached), character-defining features of the interior of Building 3 include the curvilinear lines of the stairways and metal handrails and the original light wells noted on the second floor.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] Furthermore, none of the individual buildings constructed during World War II gained significance simply because they were utilized during NAS Alameda operations and functions during the Cold War period. Buildings 3 and 63, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although these two buildings do not individually, nor as a group, possess Cold War-era significance, they remain contributing elements of the NAS Alameda Historic District (NRHP Status Code 2D2).

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1. & 2. Historic/Current name: Building 3, General Services for the BEQ and attached Building 63.
3. Street: First St. **NAS Alameda Map** K-20 City: Alameda Zip: 94501
County: Alameda Code: 001
4. UTM Zone: Oakland West, CA,
5.Quad Map No.: N3745/W12215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: a two-story, concrete building with an irregular, rectangular plan located in the quadrangle between Buildings 2 and 4 and attached to Building 63 by a hallway. The facade facing the quad has a two-story recessed porch with 6 round, concrete columns that are embedded in the building attic. The enclosed ends of this section are punctuated with small square windows set close together in the upper part of the wall. The main entrance is composed of three glazed sections divided by round concrete columns. Entrance doors are metal-framed with transoms above. The central doors are surmounted by a painted, decorative motif in the form of a segmented hemisphere with stars on the rim and the legend "Welcome Aboard N.A.S. Alameda." Set against the end walls are concrete bases with monumental concrete sculptures of rampant eagles. Typical windows are metal-framed, multiple-light, hopper sash. Attached to the back of the building is an annex, built in 1942 designated Building 63; this is a one-story, concrete building 102' by 50' with a flat roof with the typical metal-framed windows with multiple-light, hopper sash. The building has no distinctive features.

8. Planning agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11. Present use: military base
12. Zoning: none
13. Threats: none

3

NAS ALAMEDA Building 5

HISTORICAL INFORMATION

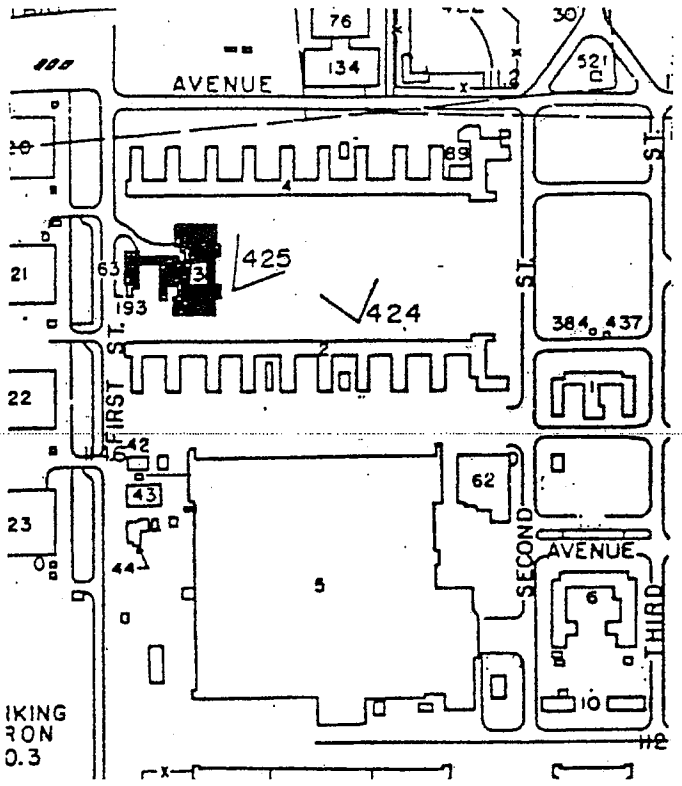
14. Construction date: 1940-Bldg. and 1942-Bldg. 63 Original location: yes
15. Alterations: none
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: Development of U.S. Navy bases in the San Francisco Bay Area for World War II. Area: NAS Alameda Period: 1938-1945. Property type: District Context formally developed: yes

19. Context: Building 3 contributes importantly to the NAS Alameda historic district under Criterion A because it was one of the original core of buildings constructed in 1940 for the base and has continued to serve in its original function of providing general services for the BEQ. Under Criterion C, it is representative of the simplified early Modern style in which the permanent buildings were designed during the early 1940s. The columned porch on the main facade is an imposing feature and is also embellished with two imposing sculptures of eagles in the geometric style characteristic of the time.
Building 63 is an annex added to Building 3 in 1942. It contributes to the district because of its date and attachment to Building 3, but it is architecturally undistinguished.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C
22. Other recognition: none
23. Evaluator: Sally B. Woodbridge, Architectural Historian Date: Fall 1990
24. Survey type: visual inspection
25. Survey name: Section 110 (A)(2)
26. Year form prepared: 1990 By: Sally B. Woodbridge Organiation: none
Address: 2273 Vine St., Berkeley, CA 94709 Phone: (415) 848-4356



JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

3. ADMINISTRATIVE CORE

The Administrative Core represents the heart of the historic district, including a large number of buildings and the most sophisticated buildings from the architectural standpoint. The area includes the following buildings: the Gate House Group (Buildings 30 and 31); the Barracks Group (Buildings 2, 3, 4, 65, and 193); the Headquarters Building (Building 1); the Bachelor Officers' Quarters Building (Building 17); the Theater-Post Office and Chapel Group (Buildings 18 and 94); the Dispensary (Building 16); and the Officers' Club (Building 60). The Administrative Core is bounded by Avenue A on the north; Fifth Street on the east; First Street on the west; and Avenue C on the south.

3.1. Architectural Vocabulary of the Administrative Core

The Administrative Core buildings represent the best expression of the "Moderne" style that was the design theme for the entire base. The Administrative Core buildings, indeed, are excellent representatives of the style, bearing most of the characteristic elements of the style: reinforced concrete materials; smooth surfaces with many curved elements; highly stylized vertical emphasis elements at the entrances; columns whose cross-section has been elongated, transforming them into aerodynamic struts; and the overriding element of horizontal bands, running continuously across the facade, over the windows and over the wall panels between the windows.

While there are important differences, particularly with respect to the Chapel (Building 94), the buildings within the Administrative Core are remarkably consistent in design. The vocabulary may be summarized with respect to the surface treatment, roof and building forms; windows and doors; and use of strong, repetitive design elements.

3.1.1. Surface, Roof and Building Forms

The dominant character of buildings in the Administrative Core is that they are made of smooth reinforced concrete walls and have flat roofs. The concrete was likely poured into plywood rather than the more common rough-board forms, giving the buildings a very smooth texture. The roofs are not actually flat; shallow slopes exist behind the flat parapets to promote drainage. For visual purposes, however, the intent and the effect is that of a truly flat roof, emphasizing the rigidly horizontal nature of the buildings generally. Building 94 -- a hip-roofed, wooden sided building -- is the only exception to this rule.

The smooth surfaces and flat roofs are particularly effective in emphasizing the horizontality of the buildings in question. The administrative buildings tend to be very long and low. Some are enormous: Buildings 2 and 4 and, to a lesser degree, Building 17 are so long they cannot be seen in their entirety from any one perspective. Even smaller buildings, such as Building 1, are long and low.

The horizontality of the buildings is best illustrated in Buildings 2 and 4. **Photograph 2** illustrates the rear wing of Building 4. The long, sweeping design is emphasized by the continuous horizontal bands in the concrete panels (these are discussed under "features and elements") and by the bands of windows, which are themselves arranged in horizontal bands (these are discussed under "windows and doors"). Building 1 is equally horizontal in its appearance, as shown in **Photograph 3**. The designers of these buildings, however, typically used vertical elements for powerful emphasis, as with the prominent entry pavilion at the center of Building 1. Another important element is the use of curved surfaces which enhance the sense of movement. These curved surfaces are also discussed under "Features and Elements". The effect of these curved elements is shown in **Photograph 4**, which illustrates the curving arcade that connects Buildings 2, 3, and 4.

In summary, the key structural elements of the Administrative Core are:

- Smooth reinforced concrete surface (except for Building 94, which is wooden sided).
- Horizontal orientation.
- Flat roofs.
- Use of vertical elements for emphasis.
- Use of curved elements for contrast.

These basic elements are extremely durable; they form the basic structural components of these sturdy reinforced concrete buildings. This is good news from the standpoint of managing these historic properties; most of the key character-defining elements of this historic district are so durable as to require very little management. As long as the buildings are still standing, these elements should still be in place.

Design review considerations for these major structural forms include:

- Preserving the original surface. These sturdy concrete surfaces are immune to nearly any kind of work except for making new openings or in-filling original openings. Window and door openings provide the "rhythm" of the building. In-filling of one of these openings breaks the rhythm and appears clumsy. In **Photograph 5**, for example, a door has been closed off; its location is shown by the canopy above it. If this area needed to be closed off, it should have been accomplished from the inside, leaving the door in place to retain the rhythm.
- Additions should be discouraged. If it is absolutely necessary to build an addition to one of these buildings, the addition must respect the surface, horizontality, and window and door patterns of the original. Very few additions have been built within the historic district; only Buildings 60 and 77 includes major additions. In neither case do the additions respect the surface, window and door patterns, or general building form of the original.
- Paint schemes should continue the pattern followed by the Navy, generally, with a light base coat for the major surface and a darker hue for the wall panels between windows as well as vertical features. This paint scheme tends to emphasize the original design scheme and works well with its horizontal bands and vertical accents.

3.1.2. Windows and Doors

The designers of NAS Alameda had in mind a predominantly horizontal appearance to the individual buildings and to the groups as a whole. That horizontality is emphasized chiefly through the forms of the buildings but was emphasized through other elements as well, especially the windows.

The basic type of window originally installed throughout the historic district was a two-over-two double-hung wooden sash, i.e. a wooden window with two movable sash, divided by muntins into two separate panes on the top and two on the bottom. Very few of these still remain. A few may still be seen on the postal sorting area of Building 18, on the east and south sides of Building 1, and on most of the second story of Building 2. Original wooden windows in Building 2 are shown in **Photograph 6**. Through the years, nearly all of these windows have been replaced, most with aluminum double-hung sash. These replacement windows are quite sympathetic in that they retain the basic geometry of the original, including the double-hung operational type and the two-over-two configuration. Replacement windows are shown in **Photograph 7**; these windows are located directly below those shown in Photograph 6. As discussed earlier, this two-over-two orientation contributes greatly to the horizontal emphasis of the design of the buildings. The aluminum replacement windows lack some of the warmth associated with wooden windows. The muntins in many of the aluminum windows are also thicker and flatter than the originals. In general, however, the hundreds (perhaps thousands) of aluminum replacement sash within the historic district are quite sympathetic to the original because they repeat the essential geometry of the original design.

It should be emphasized that the muntins of the two-over-two windows align with the incised concrete lines in the adjacent wall panels, creating a continuous horizontal band across the window areas. If the horizontal lines of the window muntins are not preserved, this long band will be broken. To appreciate the importance of the double-hung window design to the overall building, one needs only to inspect those few instances in which non-sympathetic windows have been installed. **Photograph 8** shows windows on the east face of Building 2. At the first story, the double-hung windows have been replaced with single-pane, fixed and tinted glass. These new windows violate the basic design of the building and appear out-of-place and inappropriate. **Photograph 9** illustrates a patio area of Building 17, in which the windows and doors have been replaced with modern sliding aluminum windows and doors. These replacements appear frankly modern and are easily recognizable as inappropriate to the design.

Fortunately from the standpoint of historic preservation, there are very few inappropriate windows anywhere within the NAS Alameda Historic District.

Not all windows within the Administrative Core were originally wooden or double-hung. Building 3 was originally fitted with steel windows which were hinged at the top, called "awning" type windows. These appear in groups of two and three; **Photograph 10** shows a group of steel awning windows, stacked three high, on Building 3. These steel windows are

more typical of those found in the Shops Area and in the Hangar Area, as discussed below. Steel awning windows were also used in the Officers' Club, Building 60; very few original windows remain in that building. Glass blocks were used in Building 17, the most frankly modern building in the complex. Unusual "stacked" windows were used in Buildings 1, 17, and 94; these are discussed under "Design Features and Elements." For the most part, however, windows throughout the Administrative Area were double-hung wooden sash, now replaced by aluminum double-hung sash.

The original doors within the Administrative Core area were glazed wooden doors with three, four, or five horizontal panes per door. **Photograph 11** illustrates a five-light door at a side entrance to Building 1. **Photograph 12** shows a four-light door in Building 17. **Photograph 13** illustrates a three-light door in Building 2.

There are far fewer original doors than windows within the Administrative Core. In addition, the replacement doors are much less sympathetic than the replacement windows. Modern doors are, in nearly all cases, large single-pane glass doors set in dark aluminum frames.

To summarize important window and door elements within the Administrative Core:

- Original wooden double-hung, two-over-two windows, found on Buildings 1, 2, 18, and 94.
- Appropriate metal two-over-two double-hung windows, found in buildings throughout the Administrative Core.
- Steel awning-type windows, found on Buildings 3 and 60.
- Original three-, four-, and five-light wooden doors, found on several buildings.
- Stacked windows, found principally on Buildings 1, 17, and 94.

Design review considerations for windows and doors include the following:

- The basic geometry of the windows should be repeated, even when the windows are replaced. The aluminum double-hung, two-over-two windows throughout the district show how this can be done. The sympathetic character of the aluminum replacements may be attributed to three factors: they repeat the two-over-two geometry; they are double-hung and therefore operate in the manner of the originals; and the muntins are about the size and shape of the originals.
- Under no circumstances should fixed "picture windows" or aluminum sliding windows or doors be installed; the effect of these windows are shown in Photographs 1, 6, and 7.
- Generally, a building should have only one style of window, unless it had more than one style historically. This principle is consistent with the original design and the intended uniformity of the base. In a few isolated cases, different generations of replacement windows have been installed in individual buildings. Building 4, for example, has several generations of metal double-hung windows, one of which has wider muntins, as shown later in **Photograph 14**. As the buildings are scheduled for window replacements, the windows should be brought into conformity with a single style, one that most closely approximates the original.

- Efforts should be made to retain the few original multiple-light doors still in place within the historic district.
- Replacement doors should approximate the appearance of the original doors, patterned after the three-, four-, or five-light doors.
- As a matter of economy, it would be wise for the City of Alameda to assist tenants or lessees in identifying manufacturers of windows and doors that are appropriate for the historic district. It is likely, for example, that dozens of replacement two-over-two, double-hung windows will be required over time. If each tenant were to order from a separate vendor, it is likely that the windows will be more expensive and not uniform in design. If all orders were placed with the same vendor, it is more likely that the appearance would be uniform and the costs reduced.

3.1.3. Design Features and Elements

The terms, "features" and "elements" are used to refer to components of the buildings. Elements are major parts of the building, such as the entry pavilion shown in Photograph 3. Features are smaller, generally non-structural parts of buildings, such as the horizontal bands shown in Photograph 14. The difference between the two is a matter of scale; both help to define the architectural character of the building in question.

Among the most important features and elements of the buildings in the Administrative Core are the various neo-classical and Moderne design motifs which help to define the "Moderne" of the historic district. It is pointless to debate whether the district is predominantly neo-classical or Moderne; it is both and it is this unusual blending of styles that makes the area so interesting.

The classical features within the historic district tend to be highly stylized. These features do not recreate exactly the proportions or geometry of the original classical features but rather suggest those features in a modern, streamlined interpretation. For example, the horizontal concrete bands found on most buildings in the area are vaguely reminiscent of quoins. Historically, quoins were stacked masonry units, ordinarily fitted at the corners of buildings. In the NAS Alameda, quoin-like features were incised into the concrete and used on many buildings. Quoin-like features were used chiefly in the wall panels separating the windows in many of the buildings. A typical quoin-like feature is shown in **Photograph 14**, from Building 4. This quoin-like feature was also used extensively in Building 1, as shown in **Photograph 15**. This quoin-like concrete feature was used most extensively and inventively in Building 16, as shown in **Photograph 16.**

Another feature, one with clear classical antecedents, is the column. Columns are found throughout the historic district, particularly in Buildings 2, 3, 4, and 18. The NAS Alameda column, however, is a loose interpretation of the original, being oval-shaped and aerodynamic rather than round, and without capital or base. A typical oval column is shown in **Photograph 17**, in the arcade of Building 4. More massive columns exist at the entrance to Building 3, as

shown in **Photograph 18**. Smaller columns exist on Building 18, as shown in **Photograph 19**. A larger neo-classical element is the arcade itself, found in Buildings 2, 3, 4, and 18. This element always appears with the oval columns, which support the exterior of the arcade. The columns and arcades are arguably the dominant classical elements of the historic district.

Also suggestive of classical origins are the cast stone ornaments, placed at strategic points within the Administrative Core. These include concrete Pegasus figures on Buildings 2 and 4, shown in **Photograph 20**, and eagle figures, flanking the entrance to Building 3, as shown in **Photograph 21**. It is worthy of note that the figure of Pegasus, the mythological winged horse, was chosen because of his many associations with the sea.[9]

Other design features and elements within the Administrative Core area have no precedence in classical design; these are strictly derived from the fashions of the 1930s. Nowhere is this more evident than in Building 17, the most frankly modern building within the historic district. Throughout the historic district, "stacked" elements are used, i.e., horizontal opening (usually windows) stacked in a vertical manner. Building 17 includes stacked elements on all major elevations. The large concrete elements at the ends of the major wings of Building 17 include stacked openings, as shown in **Photograph 22**. Building 17 also includes stacked glass block windows (glass blocks are also frankly modern for the time period) as shown in **Photograph 23**, and stacked corner windows, as shown in **Photograph 24**.

These "stacked" window elements are found elsewhere in the historic district: in the entry pavilion of Building 1 (see **Photograph 25**), in the theater wing of Building 18 (see **Photograph 26**), and in the belfry of the Chapel, Building 94 (see **Photograph 27**).

A smaller design feature, found throughout the Administrative Core, is a curved concrete canopy over entry doors. Curved concrete canopies exist on most of the buildings within the Administrative Core: an example, on Building 1, is shown in Photograph 11. This curved canopy is very characteristic of Moderne design from the 1930s and was used in the Shops Area as well as the Administrative Core.

Curved elements are found on buildings throughout the Administrative Core. In the general traditions of Moderne design, these curved elements are used to soften the hard edges of the concrete buildings and to give the buildings the "streamlined" look that was popular in industrial and furniture design, as well as in architecture. In the NAS Alameda Historic District, curved

[9] As part of a character defining element for the historic district, it is interesting to point out the purposeful placement of the mythological winged-horse Pegasus in front of the Bachelor's Enlisted Quarters. The waves below Pegasus' hooves are stylized. Pegasus was the winged horse of the hero Perseus. He was gift from the Gods and he enabled Perseus to rescue the distressed maiden Andromeda who had been chained to a rock in the middle of the sea to be sacrificed to the Sea Monster (Posiden). Understanding that Pegasus' many associations with the Sea and the fact that he was the "ship" which carried the hero. Perseus across the sea to defeat the "enemy" and not only rescue the maiden but save the city as well, adds a little more light to why this particular architectural ornament was chosen. Pegasus, as a flying horse with connections to the sea is a perfect classical motif for a naval air station. Also, this was Classical Mythology (ancient Greece) and compliments the use of highly stylized Classical architecture. (Navy comments, CJM)

elements are found chiefly at entrances. An example is shown in **Photograph 28**, at the entrance to a major wing of Building 4. **Photograph 29** shows a similar curved element at an entry to Building 17. Other curving entrance elements exist on Building 1 and 18. One of the most dramatic curving elements within the entire historic district is the spiral staircase, found at the entrances to Building 2 and 4; the staircase on Building 4 is shown in **Photograph 30**. Another very dramatic use of curved concrete surfacing is in Building 16, as shown in **Photograph 31**. This type of curved element was characteristic of Moderne design, particularly the sub-category of "Streamline Moderne." Building 16 is arguably the more pure example of Streamline Moderne within the historic district.

Finally, a common concrete element, utilized throughout the historic district, is a concrete planter or solid concrete element in the shape of a planter, situated in most instances at the principal entry of a building. The planters at Building 1 are arguably the most attractive, as shown in Photograph 11. In the arcades of Buildings 2 and 4, planter boxes are integrated with concrete seating areas, as shown in Photograph 17.

To summarize regarding the major character-defining elements in the Administrative Core, special attention should be paid to:

- Continuous horizontal concrete bands, or quoin like elements, used in wall panels separating windows.
- Columns, all oval in shape.
- Cast stone ornamental figures.
- "Stacked" features, usually windows.
- Curved concrete canopies.
- Curved concrete entry elements.
- Spiral staircases.
- Concrete planters.
- Concrete benches.

Design review considerations for these features and elements include:

- The major concrete features -- especially the oval columns, arcades, and quoin-like features -- are structurally integrated and should survive any proposed re-use work. The only consideration in design review has to do with paint schemes for these features. The Navy approach of contrasting paint colors for these elements appears to work well, highlighting the horizontal effect of the quoins and vertical emphasis of the columns.
- The cast stone figures should be regarded as *objects d'art* and protected under any type of re-use.
- The "stacked" features, especially those on Building 17, are major character-defining elements and should be protected in any re-use work.
- The spiral staircases in Buildings 2 and 4 are major elements of the historic district and should be treated appropriately.
- Lesser concrete elements -- planter boxes, seating, concrete canopies, and so forth -- collectively help define the historic district and should be given careful consideration under design review.

3.2. Character-Defining Elements of Building 1

Building 1 was the functional core of the base and was prominently sited; it is the first building to be seen from the historic gate house. For this reason, it was made into the showplace for the architectural theme of the base. Building 1 includes nearly all of the character-defining elements mentioned earlier, many of which have been illustrated in photographs. These include:

- Horizontal orientation with strong vertical emphasis in the entry pavilion (see Photograph 2).
- Horizontal concrete bands, or quoins.
- Curved planter boxes and concrete barriers at doorways.
- Curved concrete canopies.
- Five-light original doors (See Photograph 11).
- Some original two-over-two double-hung wooden windows and appropriate aluminum double-hung replacement windows.
- Stacked windows and cast-stone ornamentation at entry pavilion (see Photograph 24).

3.3. Character-Defining Elements of Buildings 2, 3, and 4 (also Building 63 and 193)

Buildings 2, 3, and 4 are best considered as a single entity. The buildings are united structurally via a massive arcade, which runs nearly the length of Buildings 2 and 4 and across the front of Building 3. Buildings 65 and 193 are relatively minor appendages to Building 3. This group of buildings arguably includes the best that the NAS Alameda Historic District has to offer. Virtually all character-defining elements found within the Administrative Core generally may be seen on these buildings.

Among the key character-defining elements are:

- Strong horizontal orientation with vertical elements for emphasis. The key vertical elements include the stairwells at the eastern end of Buildings 2 and 4, and the tall columns at the facade of Building 3.
- Quoin-like features.
- Cast stone figures, including the Pegasus figures at Buildings 2 and 4 and the eagle figures at the entrance to Building 3.
- Many original two-over-two double-hung wooden sash on the second story of Building 2.
- Sympathetic aluminum two-over-two double-hung sash in Buildings 2 and 4.
- Steel sash in Building 3.
- Three-light wooden doors.
- Oval columns and long arcade.
- Concrete planters and seating area.

3.4 Character-Defining Elements of Building 16.

Building 16 is a large U-shaped, two-story, flat-roofed concrete building, located immediately east of the Administration Building. It is characteristic of the general horizontal orientation of the buildings in the Administrative Core. More than any other building in the district, however, it typifies the sweeping curved concrete surfaces of the Streamline Moderne style; as noted, it is the most pure example of Streamline Moderne within the historic district. Character-defining elements include:

This form records Buildings 530, 529, and 600. Building 530 houses missile rework facilities, while Building 529 and 600 provide support to Building 530. Building 530 is an 82,251 square foot multi-level, rectangular shaped, flat metal-roof building with a large ventilation system on the west side of the roof. It is constructed on a pile supported foundation with concrete slab floors. The walls are tilt-up exposed aggregate concrete panels separated by concrete beams, some of which support metal downspouts **(Photograph 1)**. (See Continuation Sheet.)

The three buildings constituting the missile rework facility, Buildings 530, 529, and 600, are not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because they do not individually, or as a group, possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. (See Continuation Sheet.)

(This space reserved for official comments.)

***P3a. Description (cont.):**

The front or north face of the building has three large metal roll-up freight doors, one with an inset personnel door. There is a cantilevered flat shelter close to the roof line over the bay doors. The northeast end of the building has the main personnel entrance which sits under a cantilevered roof **(Photograph 2)**. The entrance consists of four pairs of metal and tinted glass doors flanked by fixed, tinted windows. Solid metal emergency doors are located to either side of the entrance. On the east side of the building there is small metal shed with a flat roof and a louvered entry door next to a large compressed air tank connected to the building **(Photograph 3)**. There is also an additional roll-up metal freight door with inset with a slab door. There are no other windows or doors around the building.

Building 529, measuring 3,200 square feet, is a rectangular flat-roofed structure that follows the same general design and uses the same materials as Building 530. The walls are tilt-up exposed aggregate concrete panels with concrete beams separating each panel and metal downspouts on both the northeast and southeast corners of the building. On the east side is a roll-up metal freight door with an inset personnel door and a set of double solid metal doors on either side. There are no windows **(Photograph 4)**. On the west side of Building 529 there is electrical substation equipment attached to the building and enclosed by a chain link security fence **(Photograph 4)**.

Building 600, located on the east side of Building 530, is a 343 square foot rectangular plan building clad in vertical seamed metal panels with a flat roof and large roof vent **(Photograph 5)**. Two louvered vents are located near the roof line on the east side.

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period.

This group of buildings is not eligible for listing in the NRHP or CRHR because neither individually nor as a group do they possess historic significance under the NRHP or CRHR criteria. Although Buildings 530, 529 and 600 participated in NAS Alameda's Overhaul and Repair and Naval Aircraft Rework Facility (NARF) operations, particularly with regard to missile rework, these buildings were not engaged in historically significant naval missions and activities.[1]

The Navy began planning for a new missile rework facility in the late 1960s. Building 530 was constructed in 1973 for a cost of $2.4 million dollars. It is approximately 82,000 square feet and was built as part of a larger "long range facility development plan" prepared by Skidmore, Owings & Merrill and used by the Naval Air Rework Facility (NARF). Avionics Division's group NARF Alameda Missile Shops moved from Building 400 to Building 530 and continued to work on Bullpup, Shrike, Sidewinder, Sparrow III (which was assigned to the station in 1959), and Phoenix missiles.

Building 529, located on the south side of Building 530, housed the generator, pumps and compressors, keeping them separate from the immediate work area in Building 530. This created a work environment which was more conducive to the precision mechanics involved in missile rework. This building also expanded Avionics Instrument, Calibration

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

and Electronic Warfare shops.[2] When constructed Building 530 was considered a major addition to the base and was described as a "Safeway" style building, reminiscent of building construction for the grocery store chain.[3] Building 600 was constructed in 1975 as a support building for Building 530. This utility building contains cooling towers and associated cooling equipment and it was noted as storing 55-gallon drums of lubricating oil and canisters of Freon. The building continued to serve as the central coolant supply from its construction until base closure in 1997.[4] No apparent modifications were made to Building 600.

Evaluation

The three buildings constituting the missile rework facility, Buildings 530, 529, and 600, were constructed during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] In the larger context of the naval operations in California and nationwide during the Cold War, the function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). The missile rework conducted within the buildings was a component of the O&R mission of NAS Alameda; however, the missile technology was not developed in these buildings and was merely repaired. While the buildings retain some integrity to their original construction, they were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for Cold War-era naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). These buildings do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, the construction and use of Buildings 530, 529, and 600 during the Cold War were not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

***P3a. Description (cont.):**

The Pan Am China Clipper commemorative monument consists of a concrete rectangular footing topped with a vertical concrete square **(Photograph 2)**. On the west (main) face of the vertical square is a brass plaque commemorating the Pan American Airways "China Clipper" which made the first commercial air flight across the Pacific Ocean. This is California Registered Historical Landmark No. 968 (see B10, below).

The Base Closure Time Capsule consists of a square concrete base laying flat against the ground with brass plaque facing the sky **(Photograph 3)**. The plaque commemorates the closing of Naval Air Station Alameda 1997. The monument marks the location of a buried time capsule, which will be opened in 2020.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual resources constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. These monuments they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria and are thus not eligible for listing in the NRHP or CRHR because. The monuments did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

These monuments memorialize various events located at, or on land that later became, NAS Alameda. Building 201187 (Historic Railroad Marker) and the Pan Am China Clipper Plaque were installed during the Cold War years of its operations, a practice typical of the routine activities of a training and support facility. The ordinary, commemorative functions of these objects do not have important associations with any unique or highly technological uses, or other historically significant themes, as required for NRHP or CRHR eligibility. None of these monuments are outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the monuments do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

[2] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

Building 201187, the monument commemorating the terminus of the transcontinental railroad, was erected in ceremonies held at NAS Alameda on September 6, 1969 – a century to the day of the arrival of the first passenger train at Alameda Point Pier from New York City. This monument is not located at the exact site at which the event occurred it commemorates occurred, it was previously located on Pier 2.[3]

Pan Am China Clipper monument, California Historical Landmark No. 968, was given to NAS Alameda on November 20, 1985 by the California Department of Parks and Recreation in cooperation with Pan American Airlines. The monument commemorates the 50th anniversary of the maiden flight of Pan Am's *China Clipper*, a Martin M/130 Flying Boat, on November 22, 1935. Traveling from Alameda to Manila, *China Clipper* inaugurated ocean airmail service and commercial air traffic across the Pacific Ocean. In May 1988, the plaque was erected at its current location. Like Building 201187, the Pan Am China Clipper plaque is not located at the exact site at which the event it commemorates occurred. The Base Closure Time Capsule was installed on April 19, 1997 to commemorate the closure of NAS Alameda in 21997. The capsule, which is to be unearthed and opened in 2020, was sponsored by the *Alameda Journal*.[4]

Evaluation

These resources were built during Cold War operations at NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, the commemorative function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). While it could be argued that the events which the monuments are meant to commemorate could have historical significance, the monuments themselves and the placing of those monuments are unremarkable, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These monuments are largely utilitarian in design, materials, and construction methodology (NRHP Criterion C / CRHR Criterion 3). None of these monuments has a direct or important association with a historically significant individual (NRHP Criterion B / CRHR Criterion 2). The monuments are not likely to reveal important historical information (NRHP Criterion D / CRHR Criterion 4). The Pan Am *China Clipper* Plaque and the Historic Railroad Marker consist solely of above-ground monuments. The Base Closure Time Capsule consists of materials buried underground that are to be unearthed in 2020; however, it is highly unlikely that the materials within the capsule are not known or discoverable through other sources. The materials in the capsule are most likely commemorative in nature, like the monument itself. Thus, the capsule is not likely to reveal important historical information. Furthermore, as solely commemorative objects, the monuments do not possess significance based on their own importance (NRHP Criterion Consideration F). Lastly, the monument's construction and use were not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings and structures constructed during the Cold War era, or World War II-era buildings and structures used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Both Building 302E and Building 302W, constructed in 1985, served a necessary purpose as navigation aids. Yet, neither had a direct or important role in NAS Alameda's operations, or A&R activities. Additionally, neither made a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Buildings 302E and 302W are two navigational aid targets (range lights) located at the south end of the Station in line with Wharf 2. 302W, which is the shorter of the two towers, is located west, and for navigational purposes in front of 302E. Upon approaching the Carrier Piers Area (recorded on a separate form), a mariner would use the lights from 302E and 302W to aligned his vessel to the correct range line. Range lights such as 302E and 302W are sometimes equipped with high density lights for daytime, are effective for long channels with hazy conditions.[1]

Many buildings and structures on NAS Alameda, such Buildings 302E and 302W, fall within the "Waterfront Operations" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include piers, wharfs, dolphins, diving lockers, maintenance shops, crane tracks, and navigation range lights. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. These buildings are utilitarian and many are of prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, these buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

Evaluation

Buildings 302E and 302W were built in the midst of Cold War operations on NAS Alameda, and were part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. In the larger context of the naval operations in California and nationwide during this period, the Waterfront Operations function of these navigation range lights did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1).

None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] The structures, moreover, while retaining integrity to the period when they was constructed are nevertheless unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Buildings 302E and 302W are utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). They have no direct or important association with a historically significant individual, and are unlikely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, despite serving a necessary purpose on NAS Alameda during the Cold War era, the construction and use of Buildings 302E and 302W are not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

The Navy Lodge facilities on NAS Alameda (Buildings 531, 532 and 533) do not appear to meet the criteria for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR).

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***P3a. Description (cont.):**

An exterior concrete and metal staircase leads to the second floor to a recessed laundry area with three doors. The second story has a wood and wire mesh balcony.

Building 532 is of similar design. The west side first floor has a glass door and metal utility door; the second story level lack openings **(Photograph 2)**. The east end has two staircases that lead to the second story balcony.

Building 533 south end has two sets of stairs as well **(Photograph 3)**. The ease side has a center door with large sliding and one single hung window for each unit. The north end has three doors at each level.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

NAS Alameda is typical of military bases of the period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

The Gelien Navy Lodge opened in May 1971, and included Buildings 531, 532, and 533. It was run by the Navy Exchange. This 75-unit facility served as temporary lodging for Navy personnel and their families during change of station orders.[1] The Navy Lodge replaced earlier versions of temporary housing, the earliest of which consisted of Quonset huts. Temporary housing for service members and families grew as families became greater part of military life after World War II. Navy Lodges can be found on most Naval facilities across the nation. Buildings 531, 532 and 533 and their units were updated periodically though their 20 year Naval use.

Evaluation

Buildings 531, 532, and 533 were built during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] In the larger context of the naval operations in California and nationwide during this period, the temporary housing function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in personnel support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources uses typical hotel and motel design for the period (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

B10. Significance (cont.):

NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings and structures constructed during the Cold War era, or World War II-era buildings and structures used during the Cold War are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Pier 4, which overlies the Oakland Estuary, served a necessary purpose; it was an aviation fuel unloading pier. Yet, this structure did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Pier 4 was built in 1953 by Fred J. Early, Inc. of San Francisco. As built, the pier was wooden and rested upon concrete-treated wooden pilings. Throughout the station's Cold War period of operations, aviation fuel was delivered to the pier. Nearly forty years following its construction, in 1993, Pier 4's deteriorated wood pilings, dolphins, decking and rails were all replaced.[1]

Many buildings and structures on NAS Alameda, such as Pier 4, fall within the "Waterfront Operations" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include piers, wharfs, dolphins, diving lockers, maintenance shops, crane tracks, and navigation range lights. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. These buildings are utilitarian and many are of prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, these buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[2]

Evaluation

Pier 4 was built in the midst of Cold War operations on NAS Alameda, and was part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

B10. Significance

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These resources did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles during the Cold War era.

NAS Alameda is typical of military bases of the Cold War period because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War II. This group also includes monumental features such as the aircraft on pedestals evaluated on this form. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Building 71: This monument is installed on a landscaped island just inside the East Gate entrance. Formerly an area used for subterranean aviation gas storage tanks, it was redeveloped in the 1970s and 1980s. Installation of the decorative landscape at the East Gate began in 1977. A movement began in 1983 to further develop the East Gate because it was the primary entrance used by military personnel and it lacked appropriate signage as well as the desired aesthetics for a major entry to the base. In 1987, as part of the redevelopment of the East Gate, Construction Battalion 416 ("Seabees") constructed the concrete foundation and pedestal for the new plane monument (Building 71) along with a new plaque mount northeast of the structure. The A-7, Corsair II airplane was likely chosen as the new symbol to represent the East Gate because of its prominent role as a jet bomber during the Vietnam War. The A-7, first produced in 1964, was developed to replace the A-4 "Skyhawk" planes because of the growing need for a ship-based bomber. The Seabees mounted the aircraft on the pedestal in 1987 where it remains. After the station closed in 1997 the City of Alameda entered a standard loan agreement with the United States government for the continued display of the A-7 Corsair II.[1]

[1] D. Wilson, "Naval Air Station Alameda East Gate Improvements Planting Plan," (1977), File 141, Landscape Plans, Maps and Plans Room, Alameda City Hall West (Building 1 former NAS Alameda), Alameda, California; Dick Rutter, former Navy officer A3 aircraft navigator who served on NAS Alameda (1971-1976), oral interview with Christopher McMorris and Rand Herbert, JRP Historical Consulting, LLC, December 18, 2009; "Base Exterior Architecture Plan, Naval Air Station Alameda," Archive Room, Alameda City Hall West (Building 1 former NAS Alameda), Alameda, California; Y.S. Wan, "Naval Air Station Alameda A-7 Pedestal East Gate Plans, Sections & Details," (1986), File 141, Landscape Plans, Maps and Plans Room, Alameda City Hall West (Building 1 former NAS Alameda), Alameda, California; Norman Birzer, Peter R. Mersky, *US Navy A-7 Corsair II Units of*

Building 521: This monument is installed on the interior side of the original main gate (north gate) in a triangularly shaped, landscaped area that was part of the initial station design. Initially, the symbol at the Main Gate was a 5-inch gun positioned opposite of the entrance. In 1958 the base captain announced a contest, calling for submission of sketches for a new symbol at the main entrance. Contest guidelines stated that new construction could cost no more than $500 and must be an appropriate symbol of the modern naval air base. It remains unclear whether the A-4 Skyhawk aircraft on a pedestal was the winner of the contest or a result of other decisions because the Public Works Center did not build the monument until 10 years later. In October 1968 they constructed the pedestal out of poured concrete forms and then mounted an A-4 Navy jet on top. The Douglas A-4 "Skyhawk" was considered a representative example of the station's operations during the 1960s because it became the Navy's standard light attack bomber in 1954. The Navy did not retire it until 1999. After the station closed in 1997 the aircraft remained on loan to the city of Alameda from the Naval Inventory Control Point at Philadelphia, Pennsylvania. High winds blew it off the pedestal and damaged it in February 2008 (**Photograph 3**). Only the concrete base and associated landscaping remain intact. [2]

Both aircraft are on long-term loan from Commander, Naval Inventory Control Point, Philadelphia to the City of Alameda.

Oral interviews yielded information about the service history of the A-4 Skyhawk. Mark Baird, Alameda resident, is currently involved in the restoration of the dismounted A-4 Skyhawk. He is a member of the Experimental Aircraft Association, Warbirds and Vintage Aircraft, and lifetime member of the Beechcraft Staggerwing Club and Museum. Mr. Baird provided the following information about the A-4 on NAS Alameda:

> Our A-4, BuNo 142200, was deployed as follows:
> 142200 c/n 11454:
>
> 23 Apr 1957 - BAR FA -------- El Segundo, CA
> 03 May 1957 - VA-113 -------- NAS Miramar, CA
> 30 Apr 1958 - VA-113 -------- USS Shangri La
> 30 Nov 1958 - VA-113 -------- NAS Miramar, CA
> 05 Jan 1959 - O&R BUAER M&S - NAS Alameda, CA
> 26 Jun 1959 - VA-125 -------- NAS Moffett Field, CA
> 13 Apr 1960 - VA-126 -------- NAS Miramar, CA
> 05 Oct 1960 - VA-125 -------- NAS Moffett Field, CA
> 31 Aug 1961 - VA-125 -------- NAS Lemoore, CA
> 19 Apr 1962 - NART ---------- NAS Los Alamitos, CA
> 28 Apr 1963 - Storage ------- NAF Litchfield Park, AZ
> 22 Oct 1965 - AFASDG ADMCS -- Davis-Mothan AFB, Tucson, AZ
> 27 Feb 1966 - O&R BUWEPS FR - NAS Alameda, CA

02 Feb 1969 - NARU ---------- NAS Alameda, CA
02 Feb 1969 - Stricken ------ 1S
*See additional information provided by Dick Rutter below

Dick Rutter, former Navy officer and A3 aircraft navigator who served on NAS Alameda from 1971 to 1976, also provided additional information about the A-4 aircraft:

> This bird was originally built as an A4D-1 (old Navy designation until "standardization of designations" by McNamara in 1960's). It was in the original production batch of 166 built for Fleet Service---after the "test birds batch" of Flight Test Prototypes and Pre-production Aircraft were constructed. The Navy issued a Contract for Douglas Aircraft to begin design work on the A-4 on 12 June 1952, and the Prototype A-4's first flight was on 22 June 1954. First deliveries of Production Aircraft to Navy and Marine Squadrons commenced in late 1956.
>
> Regarding Mark's operational timeline for A-4A BUNO 142200, under the date 03 May 1957, when with VA-113, this bird likely flew missions from USS HANCOCK (CVA-19). Under date 05 Jan 1959, our bird likely received an upgrade of IFR (Inflight Refueling) Capabilities, when it went through NARF Alameda for its Overhaul and Refit. When originally built, it did not have Inflight Refueling Capability.
>
> One of Mark's line items does not make sense at all, and that is under the date, 01 Feb 1969, "Convert to TA-4B". The TA-4's were two-place tandem seat versions that were built from scratch for that purpose. The TA-4's have a 28-inch lengthening plug inserted into their fuselages at the cockpit area to accommodate the additional seat, and there are a lot of sheet metal changes around the double canopy to get it all to fit together better. Also, the rear seat is higher than the front seat, so the instructor can better see what the student is doing up there... Also, their wings are different in many small details.
>
> There were TA-4F's, of which 241 were built, and TA-4J's (built specifically for the Training Command---no weapons capability incorporated), of which 277 were built. I believe that the line item under this date is a mistake. NARF didn't build "T-birds" out of "Attack birds". Too much modification required throughout.

Neither Mark Baird nor Dick Rutter could provide any further information about the A-7 aircraft (Building 71). The aircraft's serial number is unknown, which makes tracking its service history difficult.

Evaluation

The resources of the entrance monuments, Buildings 71 and 521, were built during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities

around the nation.[3] In the larger context of the naval operations in California and nationwide during this period, the MWR function of these resources did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). They were unremarkable in their use in adorning the station entrances, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. The simple design and construction methodology of these monuments is relatively common for naval stations of the period (NRHP Criterion C / CRHR Criterion 3). Neither of these resources has a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Building 521 lacks integrity because the A-4 Skyhawk is no longer mounted on the pedestal. Furthermore, while the monuments served a valuable function on NAS Alameda during the Cold War era ornamenting the entrance gates, their construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration). Lastly, as solely commemorative objects, the monuments do not possess significance based on their own importance (NRHP Criterion Consideration F).

***P3a. Description (cont.):**

The east side of Building 166 has a two-story building segment between the corner piers. Fenestration throughout Building 166 includes three-paneled inset third story and second story windows, and four-paneled hopper windows along the first floor. The west side has four-by-four metal framed, fixed windows along its roofline. Two sets of double metal personnel doors with shed roof overhangs are located on the west side in addition to a set of utility doors and a single metal personnel door at the north end. Large metal signs for the Naval Air Force Pacific Fleet Comnavairpac Material Representative and Comnavairpac GSE Rehab Facility are found on the north and south ends of the east side **(Photograph 1 and 2)**. Alterations of the building include replacement of the industrial mutli-pane metal sash windows with three and four-light metal windows and doors built into window sets on the east façade.

The west side of Building 166 has a two-story building segment between the corner piers. Fenestration throughout Building 167 includes fixed windows, three-by-four second story windows, and three-by-five first story, metal framed windows. The eastern and western-most doors on the façade are metal personnel doors and the main entrance consists of a metal framed glazed double door facing west. Three-by-three paneled windows run along the top of the east side of the building. The hangar doors along the north and south sides also include metal personnel doors **(Photograph 3 and 4)**. Alterations of Building 167 include the addition of doors and ramps in the original industrial metal sash windows on the west side of the building on the first floor.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This group of buildings is not eligible for listing in the NRHP or CRHR because neither individually nor as a group do they possess historic significance under the NRHP or CRHR criteria. Although Buildings 166 and 167 participated in NAS Alameda's Assembly & Repair (A&R, later Overall and Repair, or O&R, and Naval Aircraft Rework Facility, or NARF) operations, particularly with regard to aircraft preservation, these buildings were not engaged in historically significant naval missions and activities.[1] Furthermore, though the initial construction date of the buildings falls within the period of significance (1938-45), the buildings are outside of the boundaries and non-contiguous with the historic district. The buildings were late World War II additions and not completed until 1946 within an area of the base that was not purchased by the Navy until 1944. This area was not part of the original base design and was used for later expansion of the base. Also, the addition of these buildings to NAS Alameda was for future post-war operations of fleet preservation that were required at the end of the war, which had begun to wind down by 1944. Therefore, Building 166 and 167 do not have the same association as other buildings within the historic district for World War II significance.

Buildings 166 and 167 were constructed by James I. Barnes Construction Company of San Francisco in 1946, to house elements of NAS Alameda A&R activities. During World War II, Naval personnel and station employees engaged in A&R tested new materials and process, including welding Plexiglas and pioneered new techniques, such

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

as aircraft preservation; following the war, members of a newly-formed preservation department created many of the phases of the preservation procedures that were developed on NAS Alameda and later adopted as Bureau of Aeronautics (BuAer) procedures. For example, base personnel were the first to apply a phenolic resin compound to engine parts to fight erosion. With their construction, Buildings 166 and 167 became one of the primary sites for the station's aircraft preservation work.[2]

Aircraft preservation, although a time-consuming effort, made a valuable contribution to naval missions during the Cold War. Preservation involved preparing aircraft for both short- (a few days) and long-term (a few years) storage. Aircraft surfaces would first be insulated with various compounds – including sprayed on oil, paint, tar, and phenolic resin **(Photograph 5)** illustrates how pervasive such spraying could be)– to prevent degradation of metal exposed to air and climatic conditions. Aircraft would then be dehydrated through the application of silica gel desiccants placed in and around engines parts to pull out moisture. When whole planes were preserved, they were placed in "cans" – nearby special containers (Buildings 338A-H, recorded on a separate form) – that were approximately the size of four box cars with connecting air ducts to facilitate further drying. The entire process of preservation could take up to 24 hours; however, it was time well spent. Figures from the 1950s suggest that if preservation steps had not been taken for aircraft sent to Korea, nearly half of the engines would not have been in useable condition due to salt-water corrosion from the overseas voyage.[3]

In July 1948, reflecting the changing nature of naval aircraft support, the Navy's Bureau of Aeronautics (BuAer) re-designated the A&R Department as the Overhaul & Repair (O&R) Department and assigned it additional types of engines and aircraft to maintain. As the needs of the department developed further, O&R shifted from a total overhaul approach to reworking aircraft so they could return to the fleet in the shortest time possible. O&R was later incorporated into a support department for the Naval Integrated Aeronautics Program, and in April 1967, the Naval Air Rework Facility (NARF) replaced the O&R Department as part of a larger administrative reorganization within the Navy.[4]

Throughout the Cold War era, despite these administrative changes and even as preservation techniques evolved and new aircraft were adopted by the Navy, Buildings 166 and 167 continued to serve as preservation facilities. During the Vietnam War, Building 167 "cocooned" aircraft for use overseas. In this process, a powder coating was applied to aircraft surfaces to prevent moisture and corrosive damage; treated aircraft were then fully enveloped in canvas covers. Aircraft preserved in the building included Army HU-1 helicopters, A-1 Skyraiders, CH-47 Chinook helicopter, and a prototype CH-54 Aerial Crane. In the early 1970s, Engine Decanning was relocated to Building 360 from Building 166 and the vacated space in the building houses NARF's Fleet Van Support Program. Engines decanned include the TF41, TF30, T56, J52, and J65. By the 1970s, while NARF continued to utilize Building 167 for aircraft overhaul and repair, Building 166 housed not only engine overhaul repair services but also the Hull Branch of the Fleet Maintenance Assistance Group. The Hull Branch consisted of a ship fitter shop, boiler and

lagging shop, rigging and life raft shop and sail locker – all of which serviced the vessels moored at the nearby Carrier Piers Area (recorded on a separate form).[5]

Evaluation

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] Preservation of aircraft was a component of the A&R mission of the base; however, early preservation technology was developed elsewhere and merely utilized in Building 166 and 167 on NAS Alameda and other military facilities. Buildings 166 and 167, therefore, although possessing integrity to when they were constructed nevertheless do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because neither has direct or important associations with significant events or trends of that era (NRHP Criterion A / CRHR Criterion 1) or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). These buildings, moreover, do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3) nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Building 166 and 167 played valuable roles in the operations of the station, preserving technologically sophisticated aircraft; however, the use of the buildings are not historically significant to the research, design, testing and evaluation of such aircraft – functions that might have qualify the buildings for listing on National Register or the California Register.

The base railroad tracks, Building 201153, are not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historic Resources (CRHR) because they do not individually, nor as a group, retain integrity for listing under the NRHP or CRHR.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

With the assistance of the Works Progress Administration in 1935 the Army constructed roads, railroad spurs, utilities, a small runway, and well in the area now occupied by the administrative core of the base. The narrow gauge line of the Southern Pacific Railroad originally ran along the northern portion what would become the base was removed with the continued construction of NAS Alameda. A second branch of the Southern Pacific Railroad ran through the east side of the base and terminated southeast of Building 118, just north of the Alameda Belt Line.[1]

The majority of the base tracks ran from the piers, north to Overhaul & Repair (O&R) buildings, such as Building 5, Buildings 91 and 9, northeast to storage buildings including Buildings 117 and 118, or southeast past the East Gate to join the Alameda Belt Line. Between 1944 and 1949, the Navy laid additional tracks east of Ninth Street to run between the Piers and the Alameda Belt Line. In the 1950s the rail lines were improved. This included tracks laid in the Supply Annex in 1953 and in 1954 the Army Corps of Engineers drafted plans for a Railroad Holding Yard and Engine House located southeast of Mitchell Avenue, east of NAS Alameda.[2]

The development of the Cold Iron program which allowed docking ships to power down their engines and plug into port-provided-power to run on-board equipment necessitated changes in utility infrastructure along the piers. To bring power to Pier 2, in 1973 the Navy moved the Mobile Utility Service Equipment (MUSE) Transformer from Pier 3 to Pier 2. The MUSE had been installed at Pier 3 in 1971 along the railroad tracks making the equipment easily mobile. The MUSE was powered by diesel-electric and had a 1500 KW generator with a separate control unit and two 750 KW generators all mounted on the rail section located mid-point on the north side of the pier. The power was delivered to the ship's main sponson (connection point) and the aft emergency bus (electrical connection).[3]

Over the years as the Navy repaved roadways and constructed new buildings, they removed many of the tracks. Currently the system of tracks is unused with only segments of the original tracks still visible.

Evaluation

The Railroad Tracks (Building 201153) were a part of the original period of construction on the station, and fall within the period of significance of the district: 1938-1945. Although the tracks are associated with the district's significance under NRHP Criterion A (CRHR Criterion 1) for its contribution to the nation's defense during World War II, alterations to the tracks themselves prevent them from conveying their association with the World War II context. The Railroad tracks lack individual integrity due to later construction that has rendered them discontinuous preventing them from conveying their use. The standardized nature of the tracks does not embody them with distinctive characteristics of a type, period, or method of construction (NRHP Criterion C / CRHR Criterion 3). The railroad tracks therefore, do not convey their association with NAS Alameda operations during World War II, and are not a contributing element of the historic district.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station during the Cold War, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. Items such as the railroad tracks use standardized plans. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station during the Cold War, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within the Cold War context.[4]

In the larger context of the naval operations in California and nationwide during the Cold War, the Public Works function of the railroad tracks did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). It was unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations during the Cold War. The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[5] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. The railroad tracks are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). The tracks have no direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built on a concrete slab, Building 177 has a rectangular plan and is made of plywood-panel formed concrete covering 252 square feet (**Photograph 1**). Buildings 177 and 178 are located within the historic district boundary, but are non-contributing elements. The southwest side has a metal personnel door with a louvered vent above. Fenestration on the southeast side includes three three-light wooden windows with an exterior meter box and piping that leads into the ground. The northeast side has a louvered vent near the base of the building and the northwest is plain. Located between Pensacola Lane and Corpus Christie Road within the CPO Housing, Building 178 is one story concrete transformer shelter with flat roof surrounded by a parapet measuring thirteen by nineteen feet, covering 117 square feet. A four light door with louvered vent is located on the south side and a louvered vent on the north side (**Photograph 3**).

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Buildings 177 and 178 did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building contractors McGuire and Hester of Oakland built Building 177 in 1941 for $1,429.20. This building originally served as an electrical transformer house and continued in that function. There have been no additions to the building. Contractors Johnson, Drake and Piper constructed Building 178 in 1941 for $720. This building originally served as an electrical transformer house and continued in that function. There have been no additions to the building.[2]

[2] Buildings 177, 178 Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; US Navy, P-164, 1972 edition, Archives Box 38, CEC/ Seabee Museum, NBVC, Port Hueneme; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 8: The North Central Recreation Zone, Parcel 97, Building 177, Alameda Point, Alameda California," January 2001; US Navy, *P-164*, 1963 edition, Archives Box 38, CEC/ Seabee Museum, NBVC, Port Hueneme; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 16: The Housing Zone, Parcel 98, Building 178, Alameda Point, Alameda California," January 2001.

Evaluation

Buildings 177 and 178 were built at the onset of World War II operations on NAS Alameda, as a part of the infrastructure serving the station during the war and the subsequent Cold War era. In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Buildings 177 and 178 is needed to support modern urban activities, and its ubiquitous nature renders it secondary in the context of station operations. The buildings are unremarkable in their use in routine station support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). These facilities had no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). While within the boundaries of the NAS Alameda Historic District, these buildings are non-contributing elements.

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 177 and 178, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

This form is an update to the previous recordation of this building by Sally B. Woodbridge as part of the "Historic Architectural Resources Inventory for the Naval Air Station, Alameda," completed in 1992 (see attached). These buildings are contributing elements of the NAS Alameda Historic District (determined eligible for listing in the NRHP), and have a NRHP status code of 2D2.

P1. Other Identifier: Buildings 39, 40 and 41

P2 e. Other Locational Data: 950 West Tower Ave. (Building 39); 800 West Tower Ave. (Building 40); 650 West Tower Ave. (Building 41); on former Naval Air Station Alameda

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Buildings 39, 40, and 41 have been grouped on this form because of their nearly identical construction. Building 39 is 110,139 square feet, Building 40 measures 118,190 square feet and Building 41 is 118,041 square feet. These are large, rectangular, roughly three-story buildings with very low-pitched, gable roofs. The east and west sides are largely comprised of massive sliding hangar doors made of industrial sash windows with a solid lower panel. Bracketing the hangar doors are stout, rectangular corner piers built with decorative horizontal bands which stretch across the facades from pier to pier. A shed roof also goes from pier to pier and shelters the hangar doors. Some of the hangars doors have inset personnel doors or metal roll-up doors.

The north and south sides of the buildings appear as three stories with horizontal bands of multi-pane hopper and awning windows on the first two stories, and a recessed third floor with a horizontal band of windows. On the ground level are personnel doors, some single light, others multi-light. Many of the doors have concrete surrounds and appear to be replacement doors. Also, some of the windows have been filled in.

B10. Significance:

This update form was prepared to provide additional information about the Seaplane Hangars, to assess if they retain historic integrity, and to evaluate their significance under Cold War themes.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Buildings 39, 40, and 41 were constructed as maintenance Seaplane Hangars during World War II. Building 39 was constructed in 1944 by the Cahill Brothers of San Francisco, Building 40 in 1941 by Johnson, Drake and Piper, and Building 41 in 1945 by Dinwiddie Construction of Oakland.[2]

In 1950, Hangar 41 was altered for occupancy by the Fleet Logistics Air Wing Pacific. A year later the Fleet Logistics Air Wing Pacific moved out and the Naval Air Transport Squadron VR-2, was moved from Hangar 40 to 41. Hangars 40 and 39 were also assigned to Multiple Engine Squadrons in 1951. Between the 1950s and the late 1960s, the Utility Squadron was renamed the Operations Maintenance Division (OMD) and moved from Hangar 39 to Hangar 23.[3]

In the early 1960s the Aircraft Maintenance Support Equipment Branch moved from Hangar 40 into Building 13 to make room for Patrol Squadron 872, and Anti-Submarine Squadron 872 and 873, which was deactivated a year later. In the late 1960s, all aviation ground support equipment shops moved from Building 13 to Hangar 41 as part of the Aircraft Maintenance Department. The mission of the Aircraft Maintenance Department was to inspect and service aircraft support equipment, aeronautical material and components. This included disassembly, cleaning, examination, repair, modification, testing, inspection, assembly and preservation of equipment. Maintenance was performed on Station aircraft, tenant squadrons and units, as well as for NAS Fallon. A Non-Destructive Test and Inspection shop was constructed in Hangar 41 as well as a Tire and Brake shop. The expansion of the avionics shop in Hangar 41

[3] US Navy, *History of the U.S. Naval Air Station, Alameda, California, 1 Jan 1951- 30 Jun 1951*, Command History 4 of 25, 1 July 1950-31 Dec 1950, Box 1 of 2, 5757-1b, Naval Command Histories, 27 Volumes, 1940-1992, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco), 30; US Navy, *1967 Command History*, Command History 9 of 25, Box 1 of 2, 5757-1b, NAS Command History, 27 Volumes 1940 to 1992, RG 181 US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco), 10-21.

during the late 1960s doubled its former capacity; the intermediated weapons function was also relocated to Hangar 41.[4]

Fleet Logistics Squadron 55 (VR-55), was commissioned in 1976 and housed in Hangar 40. Their mission was to transport personnel and material throughout the United States, Western Pacific, and Mediterranean and the first to use the McDonnell-Douglas C-9B "Skytrain II" aircraft for its operations.[5]

In the 1970s, the center loft in Hangar 41 housed Aircrew Survival Equipment, which was part of the Aircraft Maintenance Department. Aircrew Survival Equipment were parachute riggers in charge of inspecting and repacking parachutes, rubber rafts, survival kits, oxygen regulators, and other supplies used in aircraft.[6]

In the late 1980s, Helicopter Mine Countermeasure Squadron 15 was the first active duty air squadron on NAS Alameda in over a decade. The 400 member-squadron was previously stationed in Norfolk, Virginia and used MH-53E Sea Dragon Helicopters for mine-sweeping in the Persian Gulf. The HM-15 was the first airborne mine countermeasure squadron on the West Coast and occupied areas of Hangars 39 and 40.[7]

Evaluation

Buildings 39, 40 and 41 were built during the initial construction of the station, and are contributing elements of the NAS Alameda Historic District, which was determined eligible for the NRHP under NRHP Criteria A and C, at the state level, with a period of significance of 1938-1945.[8] The contributing elements of the district each retain adequate historic integrity to that period to convey their historic significance. This previous evaluation is attached. The character-defining features of the buildings were identified in the 1997 "Guide to Preserving the Character of the Naval Air Station Alameda Historic District."[9] These are detailed on the attached sheets, and include smooth stucco surfaces above a tall concrete base, prominent pylon-like door pockets integrated into the structure, rooftop monitors, grand interior spaces with offices along the sides, immense glazed segmental hangar doors, steel industrial sash with

awning openings, steel personnel doors with transoms, copper flashing and roofing, and a decorative band above hangar doors and around door pockets.

The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[10] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 39, 40 and 41, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). Buildings 39, 40 and 41 do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although Buildings 39, 40 and 41 do not individually, nor as a group, possess Cold War-era significance, these buildings remain contributing elements of the NAS Alameda Historic District (NRHP Status Code 2D2).

***B14. Evaluator:** C. Brookshear and S. Melvin

HISTORIC RESOURCES INVENTORY
IDENTIFICATION AND LOCATION

1.&2. Historic/Current name: Buildings 20, 21, 22, 23, 11-400-12, and 39, 40, 41,
Aircraft Maintenance Hangars.
3. Locations: Hangars 20-23: First St.; Hangars 11-400-12 and 39-41: Ave. F
NAS Alameda Map J-M-19, P-21-26 City: Alameda Zip: 94501 County: Alameda Code:001
4. UTM Zone: Oakland West, CA
5. Quad Map No.: N3745-W11215/7.5 Parcel No.: none

DESCRIPTION

6. Property category: District Number of resources documented: 85
7. Existing condition: Two-story, concrete structures with metal frames and roof trusses that define a bowed roof concealed behind roof parapets. The hangars have rectangular plans and were built in two sizes: Hangars 20-23 are 254 ft. by 213 ft. by 40 ft. high; Hangars 11, 12, and 39-41 are 321 ft. by 242 ft. by 50 ft. high. Large, rectangular corner piers rising to the height of the parapet enframe the ends of the buildings. The piers are off-set from the facade and a metal shed-roof extends across the wall to shelter the sliding metal hangar doors which have solid lower sections and glazed, multiple-light upper sections. The eaves of the shed-roof are tied visually to the corner piers by a scored band around the piers. The other building elevations are stepped back above the second stories. Below the set-back, the walls are fenestrated with bands of metal-framed windows with 12-light sash on the upper story and, on the lower story, continuous metal-framed doors and windows that also form a complementary band. The tops of the walls are capped with dark bands as are the piers.

8. Planning Agency: WESTNAVFACENGCOM
9. Owner: US Government
10. Type of ownership: public
11.Present use: military base

HISTORICAL INFORMATION

14. Construction dates: Hangars 11, 12, 20-23, and 40 - 1941; Hangar 39 - 1944;
Hangar 41 - 1945 Original location: yes
15. Alterations: The area between Hangars 11 and 12 was infilled with Building 400 in the postwar period. The other hangars appear unaltered.
16. Architect: U.S. Navy Bureau of Yards and Docks Builder: N/A
17. Historic Attributes: military property - 34

SIGNIFICANCE AND EVALUATION

18. Theme: The development of U.S. Navy bases in the S.F. Bay Area for World War II. Area: NAS Alameda Period: 1938-1945 Property type: District Context formally
developed: yes

19. Context: With the exception of Hangars 11 and 12, which have lost integrity because of infill construction, the aircraft hangars contribute to the NAS Alameda Historic District under Criteria A because they were constructed during the period of significance as part of the central core and, for the most part, strongly enforce the impression of the naval air station as an historic setting. Architecturally, under Criterion C, these are handsome structures that exhibit the stylistic traits of the early Modern style of the period in their cubistic forms, unifying detail such as the banding of openings and the scored lines on the piers, and fenestration.

20. Sources: NAS Alameda records
21. Applicable National Register criteria: A and C

JRP Historical Consulting Services, "Guide to Preserving the Character of the Naval Air Station Alameda Historic District," 1997.

4. HANGARS AREA

4.1. Architectural Vocabulary of Buildings in the Hangars Area

The Hangars Area is of obvious historical importance to the NAS Alameda, which operated as an air station for more than half a century. The hangars are also among the most imposing structures within the historic district, with each building looming large and the rows of hangars creating dramatic vistas. **Photograph 35** shows the vista created by Buildings 77, 39, 40, and 41. **Photograph 36** shows the equally dramatic vista from the hangars to San Francisco Bay. The Hangars Area includes Buildings 20, 21, 22, 23, 39, 40, 41, and 77. The area exists on two sides of the historic district, facing First Street to the east and Avenue F to the north.

Although it is the most imposing area from the structural standpoint, it is a much less complex area from the design review standpoint because the buildings are nearly all the same. The seven hangars -- Buildings 20, 21, 22, 23, 39, 40, and 41 -- are essentially identical. Building 77, the passenger terminal is unique.

4.2. Surface Materials, Basic Building Forms

The seven hangars are large, steel framed buildings, surfaced in thick stucco with tall concrete foundations, or bulkheads. At the two ends of each building, the "walls" are taken up almost entirely by the hangar doors, along with the pockets for those doors at either side. These large pockets are like pylons in their sculptural form. On the side elevations, the door pocket pylons flank a two-story band of office and shop space. The hangar buildings include shed-roofed light monitors on the rooftop. The basic shape of the end wall is shown in Photograph 34; the shape of the side office wing is shown in **Photograph 37**.

Although massive, the seven hangars are rather simple buildings, from the structural as well as the architectural standpoint. In terms of the basic structure, the character-defining elements include:

- Smooth stucco surface above a tall concrete bulkhead.
- Prominent pylon-like door pockets, integrated into the structure (these door pockets are often freestanding).
- Rooftop monitors.
- Grand interior hangar spaces with office wings to either side.

The design review considerations for the basic form of the hangars include the following:

- Respecting the exterior appearance while providing maximum flexibility in the re-use of the hangar spaces. It is nearly inevitable that the huge hangar spaces will need to be subdivided for re-use. In terms of the visual contribution of these buildings, the subdivision of those interior spaces should have little or no effect on the historic district as a whole.
- Respect for the exterior appearance includes discouraging construction of additions.

Building 77 is in the Hangars Area but is a much different building type. Because it was a gateway building -- a building frequented by the visiting public -- Building 77 was treated architecturally as if it were part of the Administrative Core. The front of the building -- the elevation meant for public enjoyment -- faces the taxiway. At this elevation, Building 77 is a very Moderne structure, with curved surfaces leading to the central entry, as shown in **Photograph 38.** The entry includes a wide concrete stairway. The rear (north elevation) of the building faces the Shops Area and is much more utilitarian in design. The rear and side elevations are shown in **Photograph 39**.

Character-defining elements of Building 77 include:

- Smooth concrete surface.
- curving entry composition.
- Wide ceremonial entry stairs.

As discussed in the introduction, Building 77 was modified to include third story wings and single-pane, picture windows at the facade. This type of addition and window modification is instructive with respect to the types of modifications that should be discouraged under the design review process. The addition, one of few in the historic district, matches the curvature of the original but introduces a new material (plywood) which is not consistent with the reinforced concrete design of this building and of the historic district generally.

4.3. Windows and Doors

The key doors at the hangars are the massive hangar doors at either end. These doors, typical of aircraft repair hangar doors from the period, appear to be entirely original and also operational. These doors should be regarded as the most important elements of the seven hangars and largely irreplaceable.

Smaller windows and doors are found on the side office wings, behind the hangar door pockets. The two-story office wings include two wide bands of steel industrial sash. The steel industrial sash generally includes 16 panes in each panel, four of which open in an awning manner. In nearly all cases, the original steel industrial sash appear to be in place and operational. **Photograph 40** shows the steel industrial sash on the second story of the east side of Building 20. Building 20 is currently in use. It will be observed that many of the windows shown in that photograph have been opened, indicating the windows are operable. Retaining operational windows is a key consideration in maintaining historic buildings in an area with the climate of Alameda Island, in which windows may be opened virtually year around.

The side office wings of the hangars also include many original steel personnel doors, two of which are illustrated in **Photograph 41**. The original steel doors included steel transoms. In

many instances, these transoms have been blocked off or otherwise modified, as shown in this photograph. While minor in relation to the scale of the building, this type of modification should be discouraged during the design review process.

Building 77, although a much different type of building, includes windows and doors that are typical of the Hangars Area, including awning-type steel industrial sash. These windows are set in elegant bands at the facade, as shown in Photographs 1 and 36. Building 77 also includes steel personnel doors, similar to those used in the hangars. The windows at the facade of this building have been modified, as discussed.

The character-defining windows and doors in the Hangar Area include:
- Immense glazed segmental hangar doors.
- Steel industrial sash with awning-type openings.
- Steel personnel doors with transoms.

Design review considerations for these windows and doors include:

- The hangar doors should be regarded as irreplaceable. These should be repaired rather than replaced.
- The hangar doors should be retained, even if they must be fixed in place.
- The steel industrial sash is very difficult to replace because few companies still manufacture it. Barring emergencies, this very durable window material should be repaired rather than replaced.
- If it must be replaced, this sash should be replaced in kind. The complex window patterns and industrial appearance cannot be replicated with fixed "picture window" type sash. The clumsy effect of this type of window can be seen in Photograph 1.

The good news from a design review standpoint is that it is demonstrably possible for the hangar buildings to be re-used without damage to the character-defining windows and doors. Building 20 was being re-used at the time this report was prepared. The side windows and doors were being used as intended, as were the hangar doors, which provide convenient access to industrial areas. The "soft" elements of these buildings are apparently quite durable and have been maintained well. The office windows, for example, all appear to be operational and are being used.

4.4. Features and Elements

The character of the buildings in the Hangars Area is defined by the strictly utilitarian approach to their design. There are few features or elements that were added to these buildings strictly for the sake of architectural embellishment. The buildings were built for heavy use and are largely devoid of applied decorative elements.

Nonetheless, some of the utilitarian elements of the buildings are noteworthy. A surprising aspect of the buildings was the extensive use of copper flashing. This copper, now aged to its

natural green patina, exists on the pent roof over the hangar doors and on the parapet of the door pockets and on the sides of the office wings. This copper is almost completely intact. In a few instances, however, the copper roofing over the hangar doors has been replaced or covered with a composition shingle roofing material, which detracts from the appearance of the building. This is true, for example, with the pent roof over the hangar doors of Building 41.

In addition, the hangar buildings include a decorative band on the door pockets and across the face of the hangar door ends, defining the bottom of the pent roof over the hangar doors.

In summary, the character -defining features and elements are few but include:

- Copper flashing and roofing.
- Decorative band at the fascia of hangar door pockets and above hangar doors.

Design review considerations are relatively few as well:

- The copper flashing is a very durable material and expensive to replace. It should be repaired rather than replaced, unless shown to be beyond repair. If replaced, it should be in copper in the geometry of the original.

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The Seaplane Lagoon and its constituent features – except the fishing pier (portions of which were previously part of Seaplane Dock 3) and the remains of Seaplane Dock 4 – appear to meet the criteria for listing in the National Register of Historic Places (NRHP) as contributing elements of the NAS Alameda Historic District. The Seaplane Lagoon, along with the Bulkhead, Jetty, and Seaplane Ramps 1, 2, 3, and 4, merits inclusion in the historic district identified by architectural historian Sally Woodbridge in 1992 under Criteria A and C for the period from 1938 (the date construction of NAS Alameda began) to 1945 (the conclusion of World War II). The Seaplane Lagoon does not appear to qualify for listing in the NRHP within the context of the Cold War era; it appears neither to be associated with any known historic event or individual nor to exemplify an historic mode or manner of construction for the Cold War era. ***P3a. Description (cont.):**

Along the east side of the lagoon, between the northeastern and southeastern corners is a pier that ends in a circular platform used as a fishing pier (portions of which were likely part of Dock 3).

At the northwest corner of the Seaplane Lagoon is a barge that has been tied up since at least the 1980s (**Photograph 7**).[1] Along the lagoon's northern side, running from west to east are four ramps **(Photographs 4**, **5**, **and 6)**: Ramps 1 (Ramp 1) **(Photograph 8)**, 2 (Ramp 2) **(Photograph 10)**, 3 (Ramp 3) **(Photograph 11)**, and 4 (Building 200687) **(Photograph 12)**. The ramps are concrete, supported by wood pilings. The remains of a concrete dock, Dock 4 (Dock 4), with pressure-treated wooden bumpers and metal posts atop the bumpers can be found on the eastern side of Ramp 4 **(Photographs 13** and **14)**. All of the ramps are connected to a concrete apron. The apron rest on a bulkhead and is supported underneath by concrete pylons **(Photograph 15)**. The fishing pier (situated where Dock 3 was located) is located on the east edge of the Seaplane Lagoon and is in poor condition **(Photograph 16)**. A second barge, or a portion of a barge, is tied to Ramp 1 and is partially submerged with only a corner of the structure visible above the water line. This structure appears to have been in place on Ramp 1 since the 1980s **(Photograph 9)**.[2]

Buildings 15 and 64, the boathouse and former boiler, are built within the southeast corner of the Seaplane Lagoon and are recorded on separate forms.

B10. Significance (cont.):

Historic Context

This context provides information on the construction of the Seaplane Lagoon and its constituent parts and its contribution to the NAS Alameda Historic District through its design and operations during the World War II period.

The Seaplane Lagoon is a component of NAS Alameda's original design and construction starting in 1939, and it was an integral part of operations on NAS Alameda from the 1940s to the 1960s. The Navy established NAS Alameda as a component of its national plan to strategically develop naval aviation and to position air stations across the country during the mid to late 1930s. During World War II, NAS Alameda was effectively adapted to support naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to serve and support its important wartime activities. NAS Alameda was one of three major air stations on the west coast to support operations of aircraft carrier groups, patrol squadrons, and utility squadrons, and it conducted crucial functions for aircraft assembly and repair. Following naval aviation's successes in World War II, the Navy established the aircraft carrier as a central basis for naval operations, with operations and support activities for aircraft and carriers becoming standard Navy functions during the latter half of the twentieth century. NAS Alameda supported carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, and continued to carry out its main function of aircraft overhaul and repair. Much of the focus for military development during the Cold War, however, was on research and development of innovative aircraft and weapons. While it conducted vital functions, NAS Alameda's support role was part of the Navy's standard operations during this period and thus the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of Cold War naval missions and activities.

Although the first experiments in Naval aviation began in the 1910s with land-based airplanes, aircraft that could operate directly from the sea – seaplanes, also known as flying boats and floatplanes – were initially envisioned as the most logical application of the new technology to naval missions. Developed by aviation pioneers Henri Fabre, Glenn

[2] Email communication between Doug Delong and Christopher McMorris, August 12-13, 2010; Alameda, California Aerial Photographs, 1980, retrieved from www.historicaerials.com (accessed August 2010).

Curtiss, and John Cyril Porte, seaplanes lacked the speed and maneuverability of land-based aircraft but proved excellent patrol, rescue, and transport craft. Prior to the wide spread use of radar, patrol aircraft located targets for their associated ships. Seaplanes moved slowly but could stay aloft for long periods, covering vast ocean areas. Their ability to land on water made seaplanes ideal for search-and-rescue missions for sailors and downed aviators. The large boat hull of seaplanes, furthermore, permitted transport of needed materials to locations inaccessible to land-based aircraft.[3]

The Navy began to acquire seaplanes in the 1910s, and constructed its first seaplane facility on NAS Pensacola, between 1914 and 1918. The performance of seaplanes during World War I, and civilian use of seaplanes at locations like the Alameda Airport, further convinced the Navy of the utility of seaplanes when it began designing its air station at Alameda.[4]

As military tension around the world increased in the late 1930s, Congress requested the Secretary of the Navy submit a plan for improving the country's defenses. Admiral Arthur J. Hepburn headed a board convened to review the country's defense capabilities and make recommendations for improvements. The assertive conclusion of the Hepburn Report in 1938 was that the need for additional aircraft facilities was greater than for other military craft and the result of the report was that aviation was given priority in naval operations and planning. The Hepburn Board recommended establishing NAS Alameda as one of the major air stations on the west coast supporting both operations and aircraft assembly and repair (A&R). NAS Alameda, along with NAS Jacksonville (Florida) and NAS Quonset Point (Rhode Island) were completely new stations recommended for construction under this program, although Congress had already approved funding for NAS Alameda in 1937.[5]

The layout and construction of NAS Alameda was under a master planning process that has been referred to as a "total base design."[6] Similar to efforts made by the Army, the Navy adopted this master planning approach to design

in the years between World War I and World War II as a way to improve the efficiency and function of its facilities, and to provide greater coherence between naval bases. The Bureau of Yards and Docks (BuDocks) and the design team utilized standardized designs developed during the previous two decades by the Bureau of Aeronautics (BuAer) and the Bureau of Ordnance, which had standards for siting and constructing structures for various functions. BuDocks employed these standards and plans for many buildings and structures as it developed each station, and as a result, naval air stations built in the years just before World War II have functionally and physically similar designs and buildings. Following the Hepburn Report, BuDocks and BuAer further refined standards and requirements for naval air stations. However, local conditions necessitated alterations for improved functionality at given locations.[7] NAS Alameda followed many of the standards and requirements of the period. Yet, NAS Alameda has a more formal plan and different architectural character, both of which have been retained, than any of the other stations recommended by the Hepburn Report.

BuDocks developed an approach for NAS Alameda that placed activities and functions in relation to each other, with organization of, and circulation between, station activities and functions receiving highest priority. Following the planning principles of the period, planners located seaplane functions, piers, landplane services, industrial facilities, storage, administration, and personnel activities, in an orderly fashion so that work could flow smoothly. As a result of this organization, naval air stations designed and built in this period share similar organization.

The NAS Alameda base plan also had a comprehensive aesthetic design, in addition to its functional organization. The City Beautiful movement heavily influenced planning in the United States in the first half of the twentieth century, and can be seen in city planning as well as institutional settings such as college campuses. The movement borrowed planning concepts from the French Ecole des Beaux Arts and organized elements through the use of primary and secondary axes, which were employed on NAS Alameda. Various *partis* or shapes, such as courtyards, would then be arranged in harmony with the overall axial plan. Beaux Arts planning influenced civic planning and the design of public, governmental, and military facilities across the nation until the end of World War II. The most important aspect of Beaux Arts plans was the establishment of formal symmetrical open spaces and spatial relationships. The U.S. military had employed Beaux Arts inspired plans since World War I to develop the many new bases needed for that war and continued to use many of the designers of these throughout the period between the two wars. [8]

BuDocks used Beaux Art principles in the design of NAS Alameda as well as functional planning considerations. Early plans for NAS Alameda show that from the beginning, the station was arranged along intersecting axes. In these early plans, the north-south axis ran from the north entry gate, bisected the entry mall and Building 1, and terminated at the center line of the Seaplane Lagoon to the south. The original east-west axis bisected an open area separating the living quarters / administrative core from the shops and operational portion of the station, and was aligned with the middle of the airfield on the west end of the station. The operational areas like the Seaplane Lagoon were sited either directly on the axial line or paralleled an axis.

California Historic Military Buildings and Structures Inventory (prepared for U.S. Army Corps of Engineers, March 2000), 7-2 – 7-3. The description "total base design" is not a phrase used historically to describe the master planning process on NAS Alameda. The phrase is presented in the Statewide Study and is applied to NAS Alameda in that document.

The importance of the Seaplane Lagoon on NAS Alameda as a critical feature in the design and operation of the station is highlighted by its location on the main north-south axis of the station plan. The heavily trafficked Oakland Inner Harbor along the north side of the station was not a suitable location for seaplane operations, so the lagoon was placed at the south end of the axis, with access to open landing water. Its layout was nearly bilaterally symmetrical to the land area of the station, except where the railroad spurs serving the piers clipped the southeast corner of the lagoon. The east and west sides of the lagoon adjoin Pan Am Way and Monarch Street, two of the main north-south streets that flank the Shops and Administrative Core areas, that form the core of the station. The north-south measurement of the lagoon is equal to and correlates with the distance from Red Line Avenue to Tower Avenue that flanks the other sides of the Shops and Administrative Core areas. The Airfield was subject to similar axial and proportional considerations. As a result, the Seaplane Lagoon is nearly the same size as the core of the station and the original Airfield.

Construction of the Seaplane Lagoon was one of the first tasks undertaken in the building of NAS Alameda in 1938, and occurred prior to the construction of the landplane runways located to the northwest. Construction of the Seaplane Lagoon and two of the seaplane hangars prior to building landplane hangars and the Airfield indicates the relative importance of Navy seaplanes, or 'flying boats,' in the period before World War II. Each of the air stations established or improved during this period included seaplane facilities, although NAS Alameda was the only one with a formal, constructed Seaplane Lagoon. Following established techniques, the lagoon was formed through dredging tidelands on the southern end of the Alameda Peninsula rather than utilizing a natural feature. A bulkhead was erected in 1938 (forming the northern boundary of the lagoon) and the Navy completed the jetty and seawalls for the lagoon the following year. They were formed with two weights of rock and backfilled with dredged materials in two stages. Dredged materials from the lagoon also provided the fill for much of the remainder of the base. By 1940, the Seaplane Lagoon was substantially complete.[9]

The seaplane ramps and docks were built following dredging of the lagoon. An early plan for the station from April 1939 included construction of two seaplane ramps. This number was later expanded to four ramps; Ramps 1 and 2 were built in 1940, while Ramps 3 and 4 were constructed in 1941 (**Photograph 17**). To assist in Seaplane operations and other dock operations the boathouse (Building 15) was constructed in the lagoon in 1940, and followed by the boiler (Building 64 in 1941). These two buildings are evaluated on separate forms. In 1944, three docks were constructed to accommodate the anticipated larger Martin JRM "Mars" seaplanes (formally introduced in 1945) along the eastern side of the lagoon – known as Docks 1, 2, and 3, from west to east (**Photograph 18**). Five years later, in March 1949, Dock 1 was replaced. In 1952, a contract was let for construction of Dock 4 attached to the side of Ramp 4. The concrete pontoon dock along Ramp 4 was completed in 1953. Two years later, alterations were made to Dock 4, and in 1957, a Ferry Slip Entrance was added to Dock 4.[10]

Showing conditions on June 30, 1942," "Map of NAS Alameda, Calif. Showing conditions on June 30, 1944," and "Master Shore Station Development Plan, Part III – Section 2, General Development Plan," 30 June 1953, RG12, BuDocks Naval Shore Activities – 12th Naval District, 1942-54 – Architectural Drawings, Maps, Box 1, CEC/Seabee

The first operational aircraft, a squadron of seven seaplanes, arrived at the Seaplane Lagoon in January 1941. These craft were the first of 200. Over the next twenty years, a variety of seaplanes operated from the lagoon and Buildings 11 and 12 (the Seaplane Hangars). In addition the JRM *Mars*, these seaplanes included the Consolidated PBY *Catalina* (introduced in 1936), the Martin PBM *Mariner* (introduced in 1940), the Martin P5M *Marlin* (introduced in 1952), and the Convair R3Y *Tradewind* (introduced in 1956). These craft were assigned to Alameda's Air Transport Squadron 2 (VR-2) and later Patrol Squadron 47 (VP-47). The seaplanes of these units – particularly during World War II – played a vital role in transporting of necessary supplies to the Pacific Theater and in patrolling for enemy vessels.[11]

The Navy's increased reliance on jet aircraft in the 1950s, and increased sophistication in radar and other monitoring equipment, led to the decline in the use of seaplanes. In 1958, not long after the *Tradewind* – notorious for its unreliable turboprop engines – replaced the venerable *Mars*, VR-2 was disestablished.[12] Two years later, in August 1960, amidst concerns for debris in San Francisco Bay, the Navy relocated Alameda's last squadron of seaplanes – VP-47, a group of twelve *Marlins* – to NAS Whidbey Island. This brought an end to the seaplane era on NAS Alameda.[13]

In 1967, as part of a cost-saving service-wide retirement of the seaplane, the Department of Defense formally deactivated the seaplane component of NAS Alameda. Throughout the late 1960s and early 1970s, the Navy considered plans for the reclamation of the Seaplane Lagoon, but ultimately took no action on any proposals. By the late-1970s, Docks 1 and 2 had been removed, and Dock 3 had been converted into a fishing pier. Dock 3's structure at the shore appears to have been retained, while the Navy replaced the floating U-shaped Seaplane dock raising the new dock on new piers.[14] At some point after the last of the seaplanes left NAS Alameda a portion of Ramp 1 separated from the rest. In the mid-1980s, the abandoned lagoon – long a dumping site for solvents and other waste materials from the station – became a focus of environmental concern. Investigations of the site began in the late 1988 and continued into the 1990s, resulting in remediation efforts that continue into the present. Despite these measures, the Seaplane Lagoon is little changed from its original construction (**Photograph 19**).[15]

Evaluation

Given its centrality to the "total base design" of NAS Alameda, its importance in supporting the station's operations during World War II, and its high degree of integrity, the Seaplane Lagoon and six of its eight constituent structures meet the criteria for listing in the NRHP as a contributing resource to the NAS Alameda Historic District under NRHP Criteria A and C (California Register of Historical Resources [CRHR] 1 and 3) for the period from 1938, when construction of the station and the lagoon began, to 1945, with the conclusion of World War II. The district is a historically significant and distinguishable entity whose components lack individual distinction, but which comprise an important concentration and continuity of buildings, structures, objects, and landscape features that are united historically and aesthetically by overall plan and physical development. The Seaplane Lagoon retains sufficient historic integrity to convey its significance to the historic district's period of significance. The Seaplane Lagoon, however, does not have important associations with historically significant themes of development during the Cold War period.

Architectural historian Sally B. Woodbridge (1992) previously identified a historic district on the former NAS Alameda as significant under both Criteria A and C at the state level for the period from 1938 to 1945. The historic district encompassed the Administrative Core, the Shops Area, and Hangars Area north and northwest of the Seaplane Lagoon, as well as the Residential Area northeast of the lagoon. Included in the historic district were the seaplane ramps, but not the Seaplane Lagoon itself. For Criterion A, Woodbridge cited "the contextual theme of the district" as "the development of U.S. Navy bases in the San Francisco Bay Area for World War II"; for Criterion C, Woodbridge pointed to the "simplified version of the early Moderne style" found in the permanent, non-residential and residential buildings on the base.[16]

Under Criterion A, the Seaplane Lagoon and six of its constituent elements are contributors to the NAS Alameda Historic District because of their important role in supporting seaplane operations and their association with the strategic development of naval air stations in the 1930s, development of naval facilities in the San Francisco Bay Area during World War II, and their important associations with the station's role in Pacific theater naval operations during World War II. The Seaplane Lagoon was an important operational component of NAS Alameda, providing mooring, loading, and land transfer facilities to seaplanes operating the in the Pacific Theater. NAS Alameda was one of the major naval air stations constructed in the years prior to World War II and the only one of the three built on the West Coast that was completely new construction. The Navy's detailed attention given to construction of NAS Alameda, along with the station's hierarchical and functional qualities, illustrate and provide a direct link to the naval strategy of the mid to late 1930s for expanded facilities to serve the Pacific Fleet and the Navy's distinct efforts to increase efficiency and functionality for naval aviation in support of the military's mission of that period. Completion of the station was sped up and successfully used by the Navy in its role during World War II, wherein the new air station was an important component of fleet support for naval air power and strategic operations centered around aircraft carriers. The Seaplane Lagoon and its constituent elements provide a direct link to NAS Alameda support of a central and vital role in the Pacific theater.

Under Criterion C, the Seaplane Lagoon and its contributing elements are significant for embodying distinctive characteristics of type, period, and method of construction in its design and planning that embody the strategic development for naval air stations in the 1930s and for the important role the station's design had in support of naval air power during World War II. As noted, NAS Alameda was one of a series of stations designed prior to the war that had similar functional layouts. The Seaplane Lagoon's location in proximity to hangars and shops on one hand,

5086, Contract Task Order 0107, Modification No. 14, Prepared For Department of the Navy, Engineering Field Activity, West, Naval Air Station, Alameda California, Characterization of Seaplane Lagoon, Work Plan Addendum, Draft, June 28, 1996, Water Resources Center Archives, UC Berkeley.

[16] Sally B. Woodbridge, *Historic Architectural Resources Inventory for the Naval Air Station, Alameda*, prepared for NAS Alameda (1992), 1.

and ship facilities on the other, demonstrates the Navy's distinct efforts to provide a modern facility to increase efficiency and functionality in support of the growing importance of Navy aviation. The careful proportioning of the Seaplane Lagoon to balance the Airfield and core of the station, the alignment with these other areas, and the overall axial plan further support the importance placed on the design. The Seaplane Lagoon is an integral part of the spatial organization inherent in the overall station plan, reflecting the strong geometric and orthogonal layout of the station. Completion of the station plan was sped up and successfully used by the Navy in its role in the Pacific theater during World War II, wherein the new air station was an important component of fleet support for the strategic operations centered around aircraft carriers. The flexibility of the functional design enabled the station to rapidly expand to serve and support this important wartime activity.

The station does not, however, have significance as the important work of a master as neither the designers at BuDocks or any of the builders of NAS Alameda have been recognized for greatness in their respective field. The station also does not articulate its design plan in a manner that it fully expresses an aesthetic ideal and thus does not have significance for possessing high artistic value.

The character-defining features of the Seaplane Lagoon are its footprint of open water and six of its constituent structures. The Seaplane Lagoon is comprised of eight structures the Bulkhead (Building 200648), Jetty (Building 200650), Ramp 1, Ramp 2, Ramp 3, Ramp 4 (Building 200687), Dock 3 (Fishing Pier), and Dock 4. Six of these contribute to the historic district and are character-defining features of the Seaplane Lagoon.

Table 1. Constituent Structures of the Seaplane Lagoon

Structure	Construction Date	Contributor
Bulkhead (Building 200648)	1938-1940	Yes
Jetty (Building 200650)	1938-1940	Yes
Ramp 1	1938-1940	Yes
Ramp 2	1938-1940	Yes
Ramp 3	1941	Yes
Ramp 4 (Building 200687)	1941	Yes
Dock 3 (fishing pier)	1944 / 1970s	No
Dock 4	1952-1953	No

The Bulkhead (Building 200648) is a contributor to the NAS Alameda Historic District. The east-west oriented Bulkhead along the northern edge of the Seaplane Lagoon defines land and water portions of the station and provides a strong orthogonal element of the historic station plan. The vertical nature of the bulkhead allowed for sufficient water depth near the ramps to maneuver seaplanes and assist in transferring them to land. Constructed between 1938 and 1940, as a part of initial station construction, the bulkhead retains integrity to its period of construction. The character-defining features of the bulkhead are its vertical face, straight linear geometry, and diagonal supports.

The Jetty (Building 200650), forming the southern boundary of the Seaplane Lagoon, is a contributor to the NAS Alameda Historic District. Like the Bulkhead, the Jetty is an orthogonal element of the historic station plan. The Jetty protected the Seaplane Lagoon from wave action facilitating mooring, loading and land transfer of seaplanes. Constructed at the same time as the Bulkhead, 1938-1940, the Jetty retains integrity. Any replenishment of the rip rap has not altered the design and replacement materials have been in kind meeting the Secretary of Interior's Standards for the Treatment of Historic Properties. The character-defining features of the Jetty are its sloped rock face and straight linear geometry. Non-character defining features of the jetty are the navigation lights.

Ramps 1-4 (Ramp 1, Ramp 2, Ramp 3, and Building 200687) are contributors to the NAS Alameda Historic District. These four ramps were necessary for the transfer of seaplanes to land for maintenance and refurbishment. Despite

their poor condition the ramps retain integrity. What is likely a barge tied to Ramp 1 is not a component of the ramp and it is not a character-defining feature of the Seaplane Lagoon. The deterioration and partial removal of Dock 4 does not appear to have impacted the integrity of Ramp 4 as it operated without the dock through the period of significance. Their character-defining features are their sloped design, bridging land and water, and plain concrete surfaces on wooden piers.

Docks 3 and 4 are not contributors to the NAS Alameda Historic District. Dock 4 was constructed in 1952-1953 outside the period of significance for the district. Dock 3 was constructed in 1941, within the period of significance for the district, and was associated with seaplane operations, notably the loading and unloading of the planes. However, Dock 3 and Dock 4 lack integrity. Dock 3 was redeveloped as a fishing pier in the early 1970s diminishing the integrity of design, materials, workmanship, association and feeling. Most of Dock 4 is dismantled or severely deteriorated and lacks integrity of design, materials, workmanship, and feeling.

As for the Cold War period, the Seaplane Lagoon and its ancillary structures were little used during the era – in 1958, only one squadron of seaplanes operated from the lagoon and by the fall 1960, these twelve remaining seaplanes departed NAS Alameda. Overall the facility did not play an important role in seaplane operations during this time. The history of the station during the Cold War illustrates that neither the district, nor its contributing elements, nor any other components of the former NAS Alameda facility, had direct or important associations with historically significant Cold War-era themes. None of these facilities played an important role in weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites. Nor did NAS Alameda serve a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[17] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. The Seaplane Lagoon nor its constituent structures, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The structures that comprise the Seaplane Lagoon do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are they likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

Although the Seaplane Lagoon does not have significance within the context of the Cold War era, this multi-component resource is a contributing element of the NAS Alameda Historic District (NRHP Status Code 3D).

This form addresses 11 buildings and structures. Buildings 86, 287, 449, 468, 469, 492, 493, 562, and 592 are sewage pumping stations, Building 501 is an A/C Sanitary Facility, and Building 596 is a Sewage Lift Station. Buildings 469 and 501 are located within the NAS Alameda Historic District, but are non-contributing elements. All pumping stations except Building 592 have a small rectangular metal box marked as 'PUMP STATION # _ POWER" (**Photograph 13**). The boxes sit on low concrete platforms that are typically slightly larger than the box but can at times cover a larger area (**Photographs 2** and **3**). In some cases, related equipment is located in proximity to these buildings (**Photograph 2**). (See Continuation Sheet.)

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

***P3a. Description (cont.):**

Many of the pump stations are surrounded by concrete bollards (**Photographs 2, 3** and **10**). Building 562 is composed of two separate component buildings with low pitched gable roofs covered with gravel located on the west side of Main Gate to NAS Alameda (**Building 4**). The rectangular plan building on the west has a two level roof on the south end. Three single and one double metal personnel door are centrally located on the west wall with two full-length metal louvered vents and a recessed entrance on the south end (**Photograph 5**). Exterior piping and three security lights are visible on the west side. The square plan east building has large roof vents on the southwest and northeast corners and with metal railings (**Photograph 6**). The south side has a metal and glass personnel door. An exterior pump is located on the west side with a safety shower and crane.

Building 592 has a raised metal panel with different size metal boxes and switches mounted on its west side with conduit running from the panel into the ground below. On the south side of the panel there is a line which attaches the panel to a separate metal cabinet mounted midway on a metal pole (**Photograph 14**).

Building 469, the lift station, is built underground and has cast iron covers (**Photographs 8** and **9**). Building 493 is a series of five metal curved pipes and electrical equipment (**Photograph 11**). Building 501, a small concrete shed, is located at the southwest corner of Hangar 41 (**Photograph 12**).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. This group of sewage facilities did not have a direct or important role in NAS Alameda's operations, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]
The sewage facilities grouped together in this form represent a period of time on NAS Alameda from 1942 through 1976 and reflect the demand of adding infrastructure to support a growing naval base. Although constructed over a

[1] JRP Historical Consulting Services, "Historic Context: Themes, Property Types, and Registration Requirements," Volume 3, *California Historic Military Buildings and Structures Inventory* (prepared for U.S. Army Corps of Engineers, March 2000), 8-1.

thirty year span, these pumping stations and lifts were built with a similar design. They appear to retain their original footprint and do not exhibit significant exterior modifications.

Evaluation

Buildings 86, 287, 449, 468, 469, 492, 493, 501, 562, 592 and 596 were built during World War II and Cold War operations on NAS Alameda, as a part of the infrastructure serving the station during the war and the subsequent Cold War era. In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of these structures did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure, such as the sewage pumping stations, is needed to support modern urban activities, and its ubiquitous nature renders it secondary in the context of station operations. The building is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations during World War II or within the larger historical context of development of the San Francisco Bay Area in general. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while the Buildings 468, 469, 492, 493, 501, 592 and 596 served a necessary function on NAS Alameda during the Cold War era, their construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Period of Significance: **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Buildings 26 and 52 were constructed within the period of significance of the NAS Alameda Historic District identified by Sally B. Woodbridge in 1992, however they are not within the district boundaries and were found as "non-contributing temporary or miscellaneous, nondescript structure," thus they were not evaluated as potential contributors. This form re-evaluates the eligibility of these buildings that are located outside the extant historic district boundary for World War II significance and for potential contribution to the NAS Alameda Historic District, provides additional information about the buildings, and to evaluate the building's significance under Cold War themes.

These small arms and pyrotechnics magazines (Buildings 26 and 52) are not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. (See Continuation Sheet)

P3a. Description (cont.):

The east side lack openings; Building 26 has exterior electrical equipment and Building 52 has a caged ladder **(Photographs 2, 3)**. The south side has overhanging eaves with metal knee braces that form a shelter over the loading dock with the same metal doors as the north sides. Building 52 retains the shuttered windows and Building 26 have been filled. Building 52 has "4Y2" painted on the south side.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during World War II and used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during this period. These buildings are not eligible for listing in the NRHP or CRHR because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. Buildings 26 and 52 did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those at NAS North Island.

Building 26 and 52 were constructed in 1941 and served as storage facilities for small arms and pyrotechnics. Activities conducted within these buildings included cleaning small arms machinery and storing live ammunition and firearms. In 2001 classified material and live ammunition were still being stored in these buildings. [1]

[1] IT Corporation, "Zone Evaluation Data Summary Phase 2A Sampling; Zone 2: The Northwestern Ordnance Storage Zone, Alameda Point, Alameda, California," January 2001.

Evaluation

Because of the standardization and ubiquity of magazines on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district. Buildings 26 and 52 do not contribute to the historic district due to their location outside the boundaries. In addition to their identification as non-contributors to the historic district, the function of Buildings 26 and 52 for ammunition storage was not central to NAS Alameda World War II activities, and therefore not significant. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

These resources were built during World War II operations on NAS Alameda, and were part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, the magazine and ordnance handling function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 26 and 52 were unremarkable in their use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general (NRHP Criterion A / CRHR Criterion 1). These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These facilities do not have a direct or important association with a historically significant individual, nor are they likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Buildings 420, 440, 497, 498 and 594, which constitute the special weapons magazine area, are not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria.

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

***P3a. Description (cont.):**

Fenestration on the north side includes two nine-over-nine windows, one in the two-and-one-half-story center section and the other in the west end, and two metal personnel doors. The one-story addition on the west end of the north side has two four-over-six fixed metal windows with center pivot. The corner where the one-story addition at the east end meets the main building on the north side is exterior equipment **(Photograph 3)**.

The east side has a low-pitch gable roof with two large roof vents, a solid metal personnel, and a pair of metal personnel doors with windows. The one-story, shed roof addition to the north has a tall, two-part sliding door and two roof vents **(Photograph 4)**. The west end of the south side as two nine-over-seven metal windows and a tall two-part metal sliding door. The two-and one-half story middle section of the south side has no openings and the east end of the south side has a tall, two-part metal sliding door.

Building 440 is a 112 square foot, two-story concrete security tower with a flat built up roof **(Photograph 6)**. The second story has boarded up corner windows on each side with a raised sill and rectangular openings below and to the inside of each window. A metal exterior staircase on the west side leads to a door at the northwest corner. The first floor has corner windows and a metal door on the southwest corner. Adjacent to the tower is a board formed flammable storage unit with a slab roof. A metal blast door is located on the north side and a small vent is located under the roofline on the south side.

Building 497 is a long rectangular 5,068 square foot magazine oriented from northwest to southeast measuring 202 feet long and 25 feet wide **(Photograph 7)**. Constructed of poured concrete, the west side has seven pairs of double metal delivery doors with strap hinges and louvered vents on either side located low on the wall **(Photograph 8)**. External equipment boxes and piping are located throughout the west side. The north and south ends are sloped as is the east side **(Photograph 9)**. The roof has seven vents. This building is similar to the Type II Standard Missile Magazine illustrated in the "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel housing (1946-1989 and Ammunition Storage Facilities (1939-1974)" prepared by the Navy in 2006.[1]

Building 498 is a 68 square foot, two-story security tower on a square concrete column with a spot light on the flat roof located. The poured concrete square structure has corner windows on each side with rectangular openings to the center and below each window. A louvered vent is located on the lower south side. An external metal staircase from the west side leads to a metal personnel door on the east side **(Photograph 10)**.

Building 594 is a 3,136 square foot, one-story rectangular concrete building constructed of poured concrete with a grooved horizontal and vertical pattern. The upper roof parapet is made of concrete blocks with three rectangular cross openings along the roof on each side **(Photograph 11)**. The south and north sides have separate curved shield walls with baffles for entrances **(Photograph 12)**. The west and east sides lack openings.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military

[1]Department of the Navy, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)" Department of the Navy, October 2006, 37.

research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These buildings are not eligible for listing in the NRHP or CRHR because they do not individually, or as a group, possess historic significance under the NRHP or CRHR criteria. The buildings did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

There are less than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

This weapons magazine area was originally developed and used by the Advanced Underseas Weapons (AUW) Shop, part of the Ordnance (later Weapons) Department. Building 420, constructed in 1958, constituted the first phase of the development of the area. The shop however was quickly turned over to the FASRON116 (Fleet Aircraft Service Squadron 116), an aircraft maintenance operation, in six months after construction of Building 420; however, it appears AUW retained control of the buildings by the 1960s. Along with Buildings 43 and 102, Building 420 was among the main locations for the Weapons Department on NAS Alameda. Their services were to support the fleet by supplying weapons to the carrier *Hornet* as well as the P3A aircraft. Building 440 was constructed in 1959 as a watch tower covering a total of 112 square feet. This watch tower served as a control center for this development. Later tenants of Building 420 included the Central Torpedo Supply. Primarily this building was used for the storage and repair of torpedoes and ammunition.[2]

By the 1960s, the Navy began expanding this weapons area to meet a growing demand. Building 497, constructed in 1964, signaled a second phase of the development. This building is similar to the Type II Standard Missile Magazine illustrated in the "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel housing (1946-1989 and Ammunition Storage Facilities (1939-1974)" prepared by the Navy in 2006. Throughout this period the Navy used standardized plans for the construction of ammunition storage facilities.[3] The Cold War focus on technology resulted in the Ordnance Department handling an increased amount of live explosives that were transported through the Naval QuickTrans program. Underseas weapons were one type of material handled by the department in their remote northwestern location beyond the intersection of runways 13-31 and 7-25. The Advanced

Contract No. N62474-93-D-2151. Delivery Order No. 0034." Submitted to Southwest Division Naval Facilities Engineering Command, January 2001.

[3] Department of the Navy, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)" Department of the Navy, October 2006, 37.

Underseas Weapons Division was relocated to Moffet Field between 1965 and 1966, during which time Building 497 remained within the Weapons Division and was included in the department's restructuring. Building 498 was likely constructed as part of that expansion to supply the fleet of carriers and aircraft. [4]

Building 594, constructed in 1976, was the last addition to this weapons area, providing physical security. It has most recently been used for office and living space. While the base was in operation, the area was fenced off and included signs stating "Warning: Restricted Area-Use of Deadly Force Authorized." The building appears to be of a defensive design with the lack of openings, thick wall construction, and defensive openings along the roof line. An almost identical building constructed was constructed n NAS North Island in San Diego County, California that functioned as a Marine Ground Station.[5]

For the most part, the buildings have not undergone significant changes. In 1993, the roof on Building 420 was replaced. A year later building was scheduled for demolition, which has yet to be accomplished. No other structural changes appear to have been made to the building; however, there is fire damage along the west side of Building 420.[6] Likewise, Building 440 has undergone only minor changes, including boarding up the windows. Buildings 497, 498 and 594 are also largely unchanged from original construction.

Evaluation

Building 497 is a weapons magazine covered by program comment. The program comment is based upon building use code and covers storage for all types of ordnance. Because of the standardization and ubiquity of magazines on both Naval stations and other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Upon the completion of the thematic study by the Navy and selection of three representative

[6] IT Corporation, "Zone Evaluation Data Summary Phase 2A Sampling Zone 2: The Northwestern Ordnance Storage Zone, Alameda Point, Alameda, California. Contract No. N62474-93-D-2151. Delivery Order No. 0034." Submitted to Southwest Division Naval Facilities Engineering Command, January 2001; US Navy, *1993 Command History*, 5757-1b, Box 2 of 2 Naval Air Station Command History, RG 181, US Naval Shore Establishments, National Archives and Records Administration, Pacific Region, (San Francisco).

installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

Buildings 420, 440, 497, 498 and 594 were built during the Cold War era operations on NAS Alameda, and are part of the broader fleet support functions of the station during this period and do not constitute a district. In the context of the Cold War-era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. Based on un-classified information available, none of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Navy facilities around the nation.[7] In the larger context of the naval operations in California and nationwide during this period, the ordnance function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These resources were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). Furthermore, while Buildings 497, 498 and 594 served a necessary function on NAS Alameda during the Cold War era, their construction and use was not of exceptional importance as required for buildings less than 50 years old under NRHP Criterion Consideration G (and similar CRHR special consideration).

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

(This space reserved for official comments.)

***P3a. Description (cont.):**

Building 168: This building is the westernmost building of the three and covers the largest area measuring 117,419 square feet. The north and south sides have centralized overhead roll-up doors which replaced the original sliding doors; the sliding door frames are still in place. The west side includes five roll-up doors set within the original sliding door frames. A single metal personnel door is located south of the southernmost roll-up door. The second roll-up door from the north end of the west side has an inset personnel door. The east side of the building shows the three distinct sections of the building with the exterior visibility of concrete firewalls. The north section has a ribbon of one-over-one windows above the concrete base and a centrally located replacement roll-up door. There is a pair of mental equipment doors with vents and a single personnel door. The middle section has a ribbon of one-over-one windows below the roof and another ribbon above the concrete base on the northern half. A metal shed roof tops the wooden sheltered entrance to this section of the building. Within the shelter is a pair of personnel doors with vertical windows. This section also has a single roll-up door with an adjacent metal personnel door. The southern section of the building has two overhead roll-up doors and a solid metal personnel door.

Building 169: This is a two-part, 86,710 square feet building. Similar to Building 168, the north and south sides have centrally located replacement roll-up metal doors within the original sliding door framework. The east side includes four sliding doors and a metal personnel door near each end. The west side includes three wood sliding doors with metal frames; the one on the northern end has an adjacent metal personnel door (**Photograph 2**). Located centrally below the roof line are 15 one-over-one awning windows.

Building 170: This is a two-part building covering 91,790 square feet. The south end has the original sliding wood door fixed open to show the modern roll-up metal door (**Photograph 3**). Above the door is a modern three-part sliding window under the gable and slightly off center. The north side includes a sliding door. The southern part of the west side includes two roll-up doors with the original wood sliding doors fixed open (**Photograph 4**). There is a metal personnel door south of the southernmost freight door. The north end of the west side has a row of one-over-one wood awning windows below the roof line. A single personnel door is set within the row of windows and an exterior metal staircase provides access to it. The north end has a working wood sliding door.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time. Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period.

Many buildings and structures on NAS Alameda fall within the "storage" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include large wood or metal frame warehouse type structures. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction

methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Buildings 168, 169 and 170 were constructed by James I. Barnes Construction Co. of San Francisco in response to the rising need of managing supplies for the Navy on a more complex and demanding level. Building 168 was used for warehouse operations and was divided between the Fuel Supply Branch, Serv Mart, Public Works Commission (PWC), and Ships Storage areas. The center third of the building housed the Fuel Supply Branch shop, which operated and stored fuel transfer and loading equipment. Building 169 provided general warehouse space. Some of the activities in this building were material and ordnance storage, forklift maintenance and administrative functions. By 1968 this building was known as the Aviation Warehouse. The initial portion of Building 170 was built in 1946. The Navy constructed additions to the building until 1957. The Navy made additional modifications to the building 1985; however, Navy records are not specific about what the later alterations were. [2]

Evaluation

Buildings 168, 169, and 170 were constructed as storehouses during Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] The storage function of these building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Although they retain a measure of integrity from when they were constructed, they were unremarkable in their use in routine fleet support, and were not historically important within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. These NAS Alameda buildings are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). These buildings are typical of Cold War era storage facilities located on military bases. These buildings do not have a direct or important association with a historically significant individual, and are not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. (See Continuation Sheet.)

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Building 200727 is not eligible for listing in the NRHP or CRHR because it does not possess historic significance under the NRHP or CRHR criteria. The structure does not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did it make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Contractor Eaton Smith of San Francisco constructed the storm sewer system on NAS Alameda between 1941 and 1955. By 1957 there were 85,417 linear feet of storm sewers constructed at a cost of $387,425.13. The catch basin installed at the intersection of W. Red Line and Monarch Avenues was an addition made by L&M for $821.13. The storm sewer system was updated in 1985 and the last inventory of the system, conducted in 2008, accounted for 5,044 linear feet of adequate sewer lines and 168,725 linear feet of substandard storm sewer lines.[2]

Evaluation

The Storm Sewer System (Building 200727) was built during World War II and Cold War era operations on NAS Alameda, as a part of the infrastructure serving the station during the war and the subsequent Cold War era. In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of the storm sewers (Building 200727) did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Building 200727 is needed to support modern urban activities, and its ubiquitous nature renders it secondary in the context of station operations. The building is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations during World War II or within the larger historical context of development of the San Francisco Bay Area in general. In the context of the Cold War era, which focused on weapons research and development, weapons and

aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). In addition to lacking historical significance, updates made to the storm sewers in 1985 diminished the integrity of the system to the time of construction.

***P3a. Description (cont.):**

The squash court has a rectangular plan and is composed of two sections. The south side is a three-sided poured concrete court with six-sided east and west walls. The north section of the building is inset between the east and west sides. The building has a flat roof with a circular vent and clad in horizontal wood siding. An opening on the north side is boarded up and an exterior ladder is at the northeast corner. On the west side the flat roof of the building extends to the concrete wall and creates a covered area. (**Photograph 3** and **Photograph 4**)

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R). The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

The tennis courts were built as part of the initial construction of NAS Alameda in 1941. These courts were the site of on-base tournaments beginning in the 1940s. In the 1970s, they were refurbished as part of a larger effort to revitalize outdoor recreation sites. In 1973, as part of NAS Alameda's "Self Help" program, the lighting of the courts was improved. Four years later, new windscreens were installed. The squash court was constructed in 1945 for a total cost of $2,600. This addition was part of the early expansion of the north base recreation facilities in the vicinity of the Officer's Club. No apparent changes have been made to the structure aside from a boarded section on the north side.[1]

NAS Alameda is typical of military bases because it was designed to include buildings and structures dedicated to morale, welfare, and recreational (MWR) uses. The purpose of these facilities is to provide personnel with social activities and constructive diversions during their off-duty time. Most of this category consists of recreational facilities like playing fields and courts, bowling alley, and theater, and it also includes the chapel, post office, and exchange, most of which were constructed as part of the original station and were in service by the end of World War

[1] Structure Card 2-00698, Box 60, Naval Districts 11th & 12th Naval District, RG #11.2.3, NAVFAC Historian's Office, Naval General Reference File, NAVFAC Archive; US Navy, "Map of NAS Alameda, Calif. Showing conditions on June 30, 1942," RG12, BuDocks Naval Shore Activities – 12th Naval District, 1942-54 – Architectural Drawings, Maps, Box 1, CEC/Seabee Museum, NBVC, Port Hueneme, California; *The Carrier*, 8 September 1944 and *The Carrier*, 20 October 1944; United State Navy, *Naval Air Station, Alameda Command History, 1972*, 5757-1b, Box 2 of 2, NAS Command History, 1968-1997, RG 181, NARA (San Francisco), 19; United States Navy, *Naval Air Station Alameda 1977 Command History*, 5757-1b, Box 2 of 2, NAS Command History, 1968-1997, RG 181, NARA (San Francisco), 56; Department of the Navy, Bureau of Yards and Docks, "Detailed Inventory of Naval Shore Facilities Real Property Data, NAVDOCKS P-164, Volume 12, Districts 12 through 14," Box 38, Record Group 8 P-Books, CEC/Seabee Museum, Port Hueneme; "Map of U.S. Naval Air Station Alameda, California Showing Conditions on June 30, 1949," Record Group 12, BuDocks Naval Shore Activities – 12th Naval District, 1942-54 – Architectural Drawings, Maps, Box 1, CEC/Seabee Museum, NBVC, Port Hueneme, California.

II. The Navy's growing reliance upon the evolution of high technology during the Cold War required highly trained support staff and retention of such personnel required upgrading MWR amenities. Construction and improvements to MWR facilities grew on the station to meet the demands of its growing military and civilian population during the Vietnam conflict. As such, NAS Alameda MWR underwent many improvements in the late 1960s and throughout the 1970s to serve personnel and their dependents and included establishment of a station-based unit to assist in regular maintenance and new construction of such facilities. The Navy continued to improve and rehabilitate station MWR facilities through self help programs that remodeled base buildings, improved space functionality and reconfigured spaces for new uses.

Evaluation

These resources, Buildings 382 and 423, were built during World War II operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. Individual buildings or structures constructed during the World War II-era and used during the Cold War are not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. These structures are not eligible for listing in the NRHP or CRHR because they do not individually, nor together, possess historic significance under the NRHP or CRHR criteria. The structures do not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era. In the larger context of the naval operations in California and nationwide during this period, the MWR function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support for recreational purposes, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. Courts like these are typical of military installations. These NAS Alameda resources are largely utilitarian in design, materials, and construction methodology and are relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). As facilities used widely by a large number of people, the structures do not have a direct or important association with a historically significant individual, and are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[2] Buildings 382 and 423, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), nor an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2), nor do they exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3). These playing fields are not likely to reveal important historical information (NRHP Criterion D / CRHR Criterion 4).

B10. Significance (cont.):

Historic Context

Building 120, 121, and 122 were built in 1944 as earthen covered torpedo storehouses directly south of Building 118 (**Photograph 3**).[1] In 1968 the buildings were relocated to the northwestern corner of the base behind Buildings 26 and 52 to make room for the expansion of the Navy Exchange parking lot.[2] That year Building 120 changed its use to flammable storage and Building 122 was used for Navy Exchange storage. In 1972 Building 121 was used for ammunition storage and in 1974 was used as an inert storehouse, as was Building 120.

Evaluation

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons. The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This group of buildings is not eligible for listing in the NRHP or CRHR because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. The group did not have a direct or important role in NAS Alameda's operations, or A&R activities, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

Because of the standardization and ubiquity of magazines on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these

[1] United States Navy "Map of NAS Alameda, Calif. Showing conditions on June 30, 1944," RG12, BuDocks Naval Shore Activities – 12th Naval District, 1942-54 – Architectural Drawings, Maps, Box 1, CEC/Seabee Museum, NBVC, Port Hueneme, California.

[2] Naval Facilities Engineering Command Southwest, Aerial Photograph, "1968 aerial 7ARD09031_069."

resources. This program comment applies to ammunition storage facilities that are not a part of a historic district. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Buildings 120-122 do not contribute to the historic district due to their location outside the boundaries. In addition to their identification as non-contributors to the historic district, the function of these buildings for ammunition storage was not central to NAS Alameda World War II activities, and therefore not significant. Building 120-122 have also lost integrity due to its relocation during the expansion of the Navy Exchange on NAS Alameda in 1968. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

These resources were built during World War II operations on NAS Alameda, and were part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, the magazine and ordnance handling function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 120-122, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C; CRHR Criterion 3), nor are likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4). Furthermore, the buildings were relocated in 1968, affecting its integrity of location and setting under NRHP Criterion Consideration B (and similar CRHR special consideration).

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during these periods. These transformer stations did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 411 was constructed in 1956 in an area that already had an engine test shop (Building 66). A new Air Turbine and Overhaul (Building 398) and Compression Building (Building 399) were under construction. The transformer station was added to serve these new buildings. Building 412 housed a standby generator for Building 67 when it served as a locomotive shed. The standby generator was previously located in the Power House (Building 10) and was moved when the steam output system was expanded in the Power House.[2]

Evaluation

Buildings 411 and 412 were built during Cold War era operations on NAS Alameda, as a part of the infrastructure serving the station during the war Cold War era. In the larger context of the naval operations in California and nationwide during this period, the Infrastructure function of this building did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Buildings 411 and 412 is needed to support modern urban activities, and its ubiquitous nature renders it secondary in the context of station operations. The building is unremarkable in its use in routine fleet support, and was not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. In the context of the Cold War era, which focused on weapons research and

development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[3] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. This NAS Alameda resource is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). This facility has no direct or important association with a historically significant individual, and is not likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
Buildings 50, 51, 56, 57 and 58 are treated as a group on this form. The buildings are earthen mound magazines with a cut one-third of the way on the north side with plywood panel formed concrete walls, Buildings 50 and 51 have two metal I-beam braces across the top. Buildings 50 and 51, both measuring 1,602 square feet, have a gabled concrete support wall on one side which is higher than the concrete square wall on the opposite side. The south walls of Buildings 50 and 51 have a pair of narrow metal doors with tie-back hinges; the north wall is plain and angled approximately 110 degrees **(Photographs 1 through 3)**. Buildings 56, 57 and 58, which measure 1,415 square feet, have a similar wall plan but the concrete support walls appear to be closer in height, there are no I-beam braces and the metal doors have louvered vents **(Photograph 4 through 6)**. All of the buildings have metal vents which are located on top at the far end of the magazine.

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Buildings 50, 51, 56, 57, and 58 were constructed within the period of significance of the NAS Alameda Historic District identified by Sally B. Woodbridge in 1992, however they are not within the district boundaries and were found to be "non-contributing temporary or miscellaneous, nondescript structure," thus they were not evaluated as potential contributors. This form re-evaluates the eligibility of these buildings that are located outside the extant historic district boundary for World War II significance and for potential contribution to the NAS Alameda Historic District, provide additional information about the buildings, and to evaluate the buildings significance under Cold War themes.

These magazines (Buildings 50, 51, 56, 57, and 58) do not appear to meet the criteria for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. (See Continuation Sheet)

***B10. Significance (cont.):**

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R).

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This group of buildings is not eligible for listing in the NRHP or CRHR because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria. The group did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War era.

There are fewer than 30 buildings or structures on NAS Alameda that were designed and built as magazines or ordnance handling facilities. This property type was a necessary component of the operations and fleet support functions for NAS Alameda, as it was for any active naval station. Magazines and ordnance handling buildings were generally built according to standardized plans and designed for safe storage, durability, and efficient access. Relative to other Naval construction, magazines and ordnance handling buildings and structures are the most standardized property type. Similar magazines to those on NAS Alameda can be found across the country, and in California, such as those on NAS North Island.

Buildings 50, 51, 56, 57 and 58 were built in 1941 by Johnson, Drake and Piper and vary in size from 1,400 to 1,600 square feet. Buildings 50 and 51 were constructed as warhead magazines that appear to have been built using the "Standard Warhead Magazine (Y&D drawing #193545)" plans, but lack the four sets of interior racks that held 76 warheads each **(Photograph 3)**. Buildings 59, 57, and 58 were constructed as High Explosive Arch-Type Magazines using one of two versions of the "Standard Magazine: High Explosive Arch Type" and modified under the same contract as Buildings 50 and 51.[1] Both versions of the plan consisted of a single arch, earth-covered magazine with reinforced-concrete construction and a single steel door opening into the magazine **(Photograph 6)**.[2] The activities conducted within these buildings were limited to high explosives, such as aircraft bombs and mine storage.[3]

[1] Earnest J. Kump Co., "Technical Report and Project History Contract NOy 4165, Alameda Naval Air Station," c. 1945, Folder 4 of 23, Box 25, NOy Contracts, RG 12, Bureau of Yards and Docks, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/Seabee Museum, NBVC, Port Hueneme, California, 6, 7, 10.

[2] US Navy, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," October 2006, 27.

[3] United States, *Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corps 1940-1946*, vol. 1, (Washington, D.C.: United States Government Printing Office, 1947), 325.

Munitions have been stored in Buildings 50, 51, 56, 57 and 58 from 1941 to at least 2001.[4] Buildings 56, 57 and 58 were three of five magazines originally built along the western end of the airfield in 1941. When Runway 13-31 was constructed in 1952, two of the northernmost magazines were removed to make room for the new runway.[5]

Evaluation

Because of the standardization and ubiquity of magazines on both Naval stations and stations of other branches of the military, most examples of these property types are not eligible for listing in the NRHP or CRHR. The Advisory Council on Historic Preservation has provided a "Program Comment for World War II and Cold War Era (1939-1974) Ammunition Storage Facilities" to provide alternate Section 106 compliance methodologies for these resources. This program comment applies to ammunition storage facilities that are not a part of a historic district. The Program Comment required the Navy to develop a supplemental context to be attached as an appendix to the Army's existing context study, "Army Ammunition and Explosives Storage in the United States, 1775-1945." In addition the Navy was required to document a representative sample of the basic types of aboveground and underground ammunition storage facilities. The preliminary study, "Summary Report of Archival Research Department of the Navy Unaccompanied Personnel Housing (1946-1989) and Ammunition Storage Facilities (1939-1974)," indicates that the best representative samples are located at the Naval Surface Warfare Centers in Crane, Indiana; Dahlgren, Virginia, and Indian Head, Maryland. The buildings and structures of this type on NAS Alameda are addressed by this Program Comment as none have been identified as a contributor to a historic district. Buildings 51, 52, 56, 57, and 58 do not contribute to the historic district due to their location outside the boundaries. In addition to its identification as a non-contributor to the historic district, the function of these buildings for ammunition storage was not central to NAS Alameda World War II activities, and therefore not significant. Upon the completion of the thematic study by the Navy and selection of three representative installations the Navy's responsibility for these property types under Section 106 of the NHPA, including those on NAS Alameda, will be met.

These resources were built during World War II operations on NAS Alameda, and were part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, the magazine and ordnance handling function of these buildings did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). These were unremarkable in their use in routine fleet support, and were not historically important, within the context of station operations or within the larger historical context of development of the San Francisco Bay Area in general. This group of NAS Alameda resources is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations (NRHP Criterion C / CRHR Criterion 3). None of these facilities has a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4).

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, NAS Alameda did not play a significant role in the themes of the Cold War. None of these facilities played an important role in the technological advancements that were historically significant during the Cold War, nor did they play a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[6] NAS Alameda did not play a significant role in the themes of the

***P3a. Description (cont.):**

The north end of the west side of Building 173 has fenced in external piping and equipment.

Buildings 174A and 174B are circular concrete water tanks measuring 28 feet tall with water tables and doomed roofs capped by concrete cupolas with vents (**Photograph 3**). Access ladders are located on the east side of Building 174A and the west side of Building 174B (**Photograph 4**). The top of the water tank wall have metal banding.

B10. Significance (cont.):

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as a projection of military force in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair, but the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Individual buildings constructed during the Cold War era are therefore not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. This group of resources did not have a direct or important role in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles during the Cold War era.

Many buildings and structures on NAS Alameda fall within the "Public Works / Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[1]

Building 173 was constructed and has served as a water pumping station since it was built; Buildings 174A and 174B were constructed 1946 as well and are used to store potable water. Building 173 has three water pumps which have a pumping capacity of 7,700 gallons per minute. There does not appear to be any exterior modifications. The building and tanks retain their original location and shape.[2]

Evaluation

Buildings 173, 174A and 174B were built during the early years of Cold War operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Buildings 95, 96A, 96B and 176 are treated as a group on this form because of their collective function. Building 95 and 176 are located within the extended boundaries of the NAS Alameda Historic as presented in the report cited in P11; however, both are non-contributing elements of the district. Building 95 is a circular water tank clad in stucco with a domed roof top with six cast concrete side supports with raised edges. On the southeast side are a water level gauge and an intake/output pipe from the side into the ground **(Photograph 2)**. At the northeast edge of the building is a metal tank on concrete supports **(Photograph 3)**. Buildings 96 A and B are of the same design as Building 95 but with a flat roof **(Photograph 4)**. The south façade on Building 96 A has broken concrete with exposed rebar. Vegetation is growing on both roofs. (See Continuation Sheet.)

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Buildings 95, 96A, 96B and 176 are not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) because they do not individually, nor as a group, possess historic significance under the NRHP or CRHR criteria.

Buildings 95, 96A, 96B and 176 were constructed within the period of significance of the NAS Alameda Historic District (1938-1945) identified by Sally B. Woodbridge in 1992; however, they were not within the district boundaries and not evaluated as potential contributors. This form was prepared to: 1) evaluate the eligibility of Buildings 95, 96A, 96B and 176 within the World War II-era historic context for the station, assessing whether the buildings are historically significant and should be included in the NAS Alameda Historic District; 2) to provide additional information about Buildings 95, 96A, 96B and 176 to assess if they retain integrity; and 3) to evaluate the building's significance under Cold War themes. (See Continuation Sheet.)

***P3a. Description (cont.):**

Building 176 has a rectangular plan and is partially below grade. Constructed of plywood formed concrete, the flat roof building has a set of metal utility doors on the south side with a concrete ramp, metal railings, and concrete sides leading to the doors partially below grade. An exterior water pipe leads into the ground and into the south side of the building. The east and west sides are plain. It is associated with Building 95 as a water pumping station **(Photograph 5)**.

B10. Significance (cont.):

Historic Context

The Navy began construction of Naval Air Station Alameda (NAS Alameda) as a component of the Navy's national plan to strategically position air stations across the country during the years prior to World War II. The new facility was built in part on a former US Army base and airport where Pan American Airline clippers operated in the 1930s. During World War II, NAS Alameda supported naval air power, which played a central and vital role in the Pacific theater. The station grew rapidly to enable it to service and support this important wartime activity and was one of three major air stations on the west coast to support both operations, and aircraft assembly and repair (A&R) for up to four carrier groups and five patrol squadrons.

The Navy went on to establish the aircraft carrier as a central basis for naval operations as it emerged from its successes in World War II, but it was research and development of innovative aircraft and weapons that became the focus of military development in the post war years. NAS Alameda continued to support carrier operations as part of naval actions and participation in overseas conflicts during the Cold War era, as well as its main function of aircraft overhaul and repair. Nevertheless, the station did not play an important direct role in advancement of military research, testing, development, or evaluation of aircraft or weapons systems, which constituted the historically significant themes of naval missions and activities during that time.

Water tanks 95, 96A and 96B were constructed in 1943 by Johnson, Drake and Piper. Building 95 is located at the northwest corner of the residential area and is a 125,000 gallon non-potable water tank with a booster pump connected to former Army well mains. Buildings 96 A and B are located at the northwest corner of the base north of the air field. They are 125,000 gallon ground level potable water tanks connected to former Pan American well mains.[1]

Building176 was also constructed by contractors Johnson Drake and Piper in 1943. It served as a potable water pump house and enclosed a well dug in 1931 by the Army. The pump house had a capacity of pumping 200 gallons per minute. There have been no additions to the building.[2]

Individual buildings constructed during the Cold War era, or World War II-era buildings used during the Cold War, are not imbued with significance simply because they were part of NAS Alameda operations and functions during the period. Buildings 95, 96A, 96B and 176 are not eligible for listing in the NRHP or CRHR because they do not possess historic significance under the NRHP or CRHR criteria. The structures did not have a direct or important role

[1] NOy 4165 folder 5 of 23, Box 26 NOy Contracts, RG 12, Bureau of Yards and Docks, NAVFAC Archive, CEC/ Seabee Museum, NBVC Port Hueneme; US Navy, *P-164,* 1974 edition, Box 67, RG 8, CEC/ Seabee Museum, NBVC Port Hueneme, 1755.

[2] Building 176, Box 59 Property Cards, RG#11.2.3, Naval Districts, 11th and 12th Naval District, NAVFAC Historian's Office Navy General Reference Files, NAVFAC Archive, CEC/ Seabee Museum, NBVC, Port Hueneme; US Navy, *P-164*, 1963 edition, Archives Box 38, CEC/ Seabee Museum, NBVC Port Hueneme; IT Corporation, "Parcel Evaluation Data Summary Phase 2A Sampling Zone 8: The North Central Recreation Zone, Parcel 97, Building 176, Alameda Point, Alameda California," January 2001.

in NAS Alameda's operations, nor did they make a significant contribution to the understanding of these roles either during World War II or the Cold War eras.

Many buildings and structures on NAS Alameda fall within the "Infrastructure" property type. These properties were not directly related to the primary mission of the station, but were constructed as necessary elements of a functioning naval facility. Typical buildings and structures within this category include shops, loading docks, guard towers, and paved areas, as well as utilities such as tanks, pipelines, pump houses, electrical substations, and waste treatment facilities. The ordinary functions of this property type are not unique and do not have important associations with any historically significant themes of development on NAS Alameda, as required for NRHP or CRHR eligibility. The buildings are utilitarian and many are prefabricated construction. As such, they do not embody outstanding examples of a type or style of architecture, nor do they represent particular advances in technology or construction methods. Although broadly related to the support and operations context of the station, the buildings and structures do not individually, nor as a group, have a direct or important association with a historically significant event or theme within that context.[3]

Evaluation

Buildings 95, 96A, 96B and 176 were built during World War II operations on NAS Alameda, and are part of the broader fleet support functions of the station during that time. In the larger context of the naval operations in California and nationwide during this period, Buildings 95, 96A, 96B and 176 did not play a direct or important role in significant historic events or trends (NRHP Criterion A / CRHR Criterion 1). Infrastructure such as Buildings 95, 96A, 96B and 176 is needed to support modern urban activities, and its ubiquitous nature renders it secondary in the context of station operations. The buildings are unremarkable in their use in routine station support, and were not historically important, within the context of station operations or within the larger historical of development of the San Francisco Bay Area in general. Buildings 95, 96A, 96B and 176 is largely utilitarian in design, materials, and construction methodology and is relatively common for naval stations or aircraft handling facilities (NRHP Criterion C / CRHR Criterion 3). Buildings 95, 96A, 96B and 176 do not have a direct or important association with a historically significant individual, and none are likely to reveal important historical information (NRHP Criteria B and D / CRHR Criteria 2 and 4). While Building 95 and Building 176 are within the boundaries of the NAS Alameda Historic District, these buildings are non-contributing elements.

In the context of the Cold War era, which focused on weapons research and development, weapons and aircraft testing and evaluation, early warning systems and electronic warfare, strategic nuclear capabilities, intercontinental and anti-ballistic missile installations, or man in space sites, nor did NAS Alameda serve a historically significant role in Naval operations overseas; rather, NAS Alameda performed functions in support of operations similar to those undertaken at other air stations and Naval facilities around the nation.[4] NAS Alameda did not play a significant role in the themes of the Cold War; therefore no building or structure on NAS Alameda constructed after 1945, or built prior to 1946 and reused after World War II, possesses significance in the Cold War period. Buildings 95, 96A, 96B and 176, therefore, do not meet the criteria for listing in the NRHP or CRHR within the context of the Cold War because they do not have direct or important associations with either the important events or trends of that era (NRHP Criterion A / CRHR Criterion 1), or an historically significant individual of that era (NRHP Criterion B / CRHR Criterion 2). The buildings do not exemplify an important type, period, or method of construction of the Cold War era (NRHP Criterion C / CRHR Criterion 3), nor are likely to reveal important historical information about that period (NRHP Criterion D / CRHR Criterion 4).

APPENDIX D:

PREPARERS' QUALIFICATIONS

JRP partners Christopher McMorris, Meta Bunse, and Rand Herbert were the principal investigators and fieldwork supervisors for the NAS Alameda Combined Specific Buildings Evaluation Report / Cold War Era Historic Resources Evaluation Report. They conducted fieldwork and research, provided project direction and oversight for the preparation of the report, and edited the report and DPR 523 forms. Based on their level of education and experience, Mr. McMorris, Ms. Bunse, and Mr. Herbert qualify as historian/architectural historians under the United States Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR Part 61). All three have conducted multiple historic resources surveys for the Navy and other branches of the military.

Mr. McMorris (MS Historic Preservation, Columbia University, 1998) has thirteen years of experience conducting historic resources projects in California. He specializes in conducting historic resource studies for compliance with Section 106 of the National Historic Preservation Act and the California Environmental Quality Act as well as other historic preservation projects. He has served as a lead historian, principal investigator, and project manager on projects for federal, state, and local government as well as for engineering/environmental consulting firms. Ms. Bunse (MA Public History, California State University, Sacramento, 1996) has over twenty years experience that includes cultural resources management projects, extensive field recordation of historic properties throughout the state of California, as well as a substantial amount of research at many public and private repositories. Mr. Herbert (MAT History, University of California, Davis, 1977) has more than 30 years professional experience working as a consulting historian and architectural historian on a wide variety of historical research and cultural resource management projects as a researcher, writer, and project manager.

Multiple JRP staff architectural historians and historians performed research and fieldwork, as well as prepared components of the report, including the contextual statement, DPR 523 forms, and evaluations, for the NAS Alameda Combined Specific Buildings Evaluation Report / Cold War Era Historic Resources Evaluation Report. They included Cheryl Brookshear (MS Historic Preservation, University of Pennsylvania, 2000), Steven J. Melvin (MA Public History, California State University, Sacramento, 2007), Joseph Freeman (MA History, University of California, Riverside, 2007), Heather Norby (MA History, University of California, Berkeley, 2002), and Scott Miltenberger (PhD History, University of California, Davis). Based on their experience and qualifications, the JRP staff architectural historians and historians each qualify as a historian and/or an architectural historian under the United States Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR Part 61).

Research Assistant Chandra Miller (MA Public History, California State University, Sacramento, in progress) performed research, fieldwork, prepared portions of the DPR 523 forms, and

evaluations for the report. Research Assistant Karen Clementi (MA Public History, Sacramento State University, in progress) assisted with fieldwork, research, prepared graphics, and prepared portions of the DPR 523 forms. Research Assistant Jarma Jones (MA History, New Mexico State University, 2007) assisted with fieldwork, edited the report, and prepared portions of the DPR 523 forms. Production Technician Rebecca Flores assisted with graphics production and fieldwork. Ms. Flores also assisted with GIS layer data.

APPENDIX E:

INFORMATION REGARDING GIS DATA LAYERS

Information Regarding GIS Data layers

For the NAS Alameda Combined Specific Buildings Evaluation Report / Cold War Era Historic Resources Evaluation Report

---

The GIS data layers provided with the Combined Specific Buildings Evaluation Report / Cold War Era Historic Resources Evaluation Report depict buildings, structures, and objects that were inventoried and evaluated on NAS Alameda. The layers identify the NAS Alameda Historic District and its contributing buildings and structures. The NAS Alameda Historic District is eligible for listing in the National Register of Historic Places the single historic property on the facility. The layers include revised boundaries for the historic district and illustrate both contributing and non-contributing resources within the historic district. The layers also illustrate the NRHP status of resources outside the boundaries of the historic district and show that no buildings, structures, or objects are NRHP-eligible outside the revised historic district boundaries.

The GIS data layers have been structured and derived from the original GIS map layers provided by Tetra Tech EM, Inc. The UTM coordinates are stored in North American Datum of 1927 (NAD 27) projection. The attribute tables, separate from internal ArcView attribute tables, have been exported and stored in an external database in a Microsoft Access data file, ALAMEDA_BASEMAP.mdb.

JRP is providing file (map) "NAS Alameda GIS Map," along with six GIS data layers. They include both interpretive layers illustrating results of the report and additional base maps not provided with the original GIS data layers. The layers are labeled as follows:

- NAS Alameda
- NAS Airfield
- NAS Alameda Historic District
- Combined Specific Bldg and Cold War Era Study
- NAS Alameda General Development Map (edited)
- 2005 Alameda County Aerial
- ca-sid

The **NAS Alameda** layer encompasses all buildings, structures, objects, sites, and districts inventoried for this study. The layer reflects the NRHP eligibility of those resources. The NRHP eligibility has been color coded as follows: green for *Contributing to a Historic District*, orange for *Not Contributing to Historic District*, grey for *Not Eligible* and beige for *Built after 1989*. The **NAS Airfield** layer afforded JRP the ability to illustrate the airfield components such

as taxiways and runways as separate unit. The **NAS Alameda Historic District**, shown with a blue outline, depicts historic district boundary lines that resulted from this study, along with the NRHP eligibility of resources within the historic district boundary. The **NAS Alameda General Development Map (edited)** is the base map for the historic district graphic from Jones & Stokes, "Pre-Final National Register of Historic Places Nomination for the NAS Alameda Historic District," 2008, as provided by the Navy. Portions of this layer is also derived from the Facilities Management Office, "Naval Air Station Alameda" map of the facility from 1993. PGA Design, Inc. and JRP edited this base map to better reflect current conditions on the former station. This layer is used to depict the station at various scale for various parts of the facility. The base maps JRP is also providing are the **2005 Alameda County Aerial** downloaded from the State of California's GIS website page "CAL-ATLAS GEOSPATIAL CLEARINGHOUSE" at www.atlas.ca.gov and the **ca-sid** layer which provides a USGS topographic map that includes the "Oakland West" 7.5 series quadrangle. Both the aerial and topographic maps were georeferenced into the existing layers provided by Tetra Tech.

PROGRAM COMMENTS

PMOA World War II Temporary Military Buildings

Program Comment for World War II and Cold War Era (1938-1974) Ammunition Storage Facilities

Program Comment for Wherry and Capehart Era Family Housing at Air Force and Navy Bases

PROGRAMMATIC MEMORANDUM OF AGREEMENT

AMONG

THE UNITED STATES DEPARTMENT OF DEFENSE

THE ADVISORY COUNCIL ON HISTORIC PRESERVATION

AND THE

NATIONAL CONFERENCE OF STATE HISTORIC PRESERVATION OFFICERS

WHEREAS, the Department of Defense (DoD) has been directed by United States Senate Armed Services Committee Report 97-440 to the Military Construction Authorization Bill for 1983 to demolish World War II (1939-1946) temporary buildings (buildings); and

WHEREAS, these buildings were not constructed to be permanent facilities and were intended to be demolished; and

WHEREAS, DoD has determined that these buildings may meet the criteria of the National Register of Historic Places; and

WHEREAS, DoD has determined that its program of demolition of these buildings (program) may have an effect on their qualities of significance and has requested the comments of the Advisory Council on Historic Preservation (Council) pursuant to Section 106 of the National Historic Preservation Act, as amended, (16 U.S.C. 470f) and its implementing regulations, "Protection of Historic and Cultural Properties" (36 CFR Part 800).

NOW, THEREFORE, DoD, the National Conference of State Historic Preservation Officers (NCSHPO), and the Council agree that the Program will be carried out in accordance with the following stipulations in order to take into account the effect of the undertaking on historic properties.

STIPULATIONS

I. DoD will ensure that the following actions are carried out:

A. In consultation with the Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) (National Park Service, Washington, DC), DoD will develop documentation that includes:

1. A narrative overview of WW II military construction establishing the overall historical context and construction characteristics of each major type of building and including:

a. Explanation of the origins and derivations of the construction techniques and designs.

c/16/86

b. Chronology that summarizes the political and military decisions that affected scheduling, locations, quantity, design, and construction techniques. Photocopies shall be made of all military manuals used to guide significant aspects of design or construction.

c. Summary statements of major installations' WW II development including site plans, lists of buildings, photocopies of appropriate photographs, and evaluations of the significance of the various building types and groups.

2. Documentation of one example of all major building types that includes: drawings (title sheet, floor plans, sections, elevations, and isometrics of framing systems and other pertinent construction details), photographs (perspective corrected, large format negative and contact print), and appropriate explanatory data. All documentation shall meet HABS/HAER Standards for format and archival stability.

3. Submission of the above documentation to HABS/HAER, for deposit in the Library of Congress, not later than three years from the date of this agreement.

4. Development of the above documentation will be undertaken with periodic reviews by HABS/HAER to ensure that completed documentation will meet HABS/HAER Standards.

B. In consultation with the Council and the NCSHPO, DoD will select some examples of building types or groups to treat in accordance with historic preservation plans (HPP), until such time as demolished or removed from DoD control. The HPPs will be submitted to the Council and the NCSHPO within three years from the date of this agreement. Work done in accordance with the HPPs will require no further review by a SHPO or the Council.

C. All buildings that are identified within sixty days of the Federal Register publication of this Agreement by organizations and individuals will be considered by DoD in its selection of examples to be documented and/or treated in accordance with Stipulations A and B above.

D. Until the documentation program is completed and HPPs have been developed for the representative sample of building types and groups, DoD will continue its current program of building demolition with caution, avoiding disposal of obviously unique and well-preserved, original buildings that are not documented.

II. NCSHPO agrees to:

A. Assist the appropriate SHPO in informing DoD within sixty days of the Federal Register publication of this agreement of buildings that they wish to have considered in the selection of examples to be documented and/or treated in accordance with Stipulations I.A and I.B.

6/6/86

B. Represent all SHPOs in the consultation on a selection of examples of buildings to be treated in accordance with Stipulation I.B.

III. If any of the signatories to this Agreement determines that the terms of the Agreement cannot be met or believes that a change is necessary, the signatory will immediately request an amendment or addendum to the Agreement. Such an amendment or addendum will be executed in the same manner as the original Agreement.

EXECUTION of this Agreement evidences that DoD has afforded the Council a reasonable opportunity to comment on its program of disposal of temporary WW II buildings and that DoD has taken into account the effects of this program on historic resources.

AMENDMENT to the
PROGRAMMATIC MEMORANDUM OF AGREEMENT
among
THE UNITED STATES DEPARTMENT OF DEFENSE,
THE ADVISORY COUNCIL ON HISTORIC PRESERVATION,
NATIONAL CONFERENCE OF STATE HISTORIC PRESERVATION OFFICERS, and the
HISTORIC AMERICAN BUILDINGS SURVEY/ HISTORIC AMERICAN ENGINEERING RECORD, regarding
DEMOLITION OF WORLD WAR II TEMPORARY BUILDINGS

WHEREAS, the Department of Defense (DOD), the Advisory Council on Historic Preservation (Council) and the National Conference of State Historic Preservation (NCSHPO), and the Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) entered into a Programmatic Memorandum of Agreement (PMOA) under Section 106 of the National Historic Preservation Act, which became effective on June 7, 1986, regarding the demolition of World War II temporary (buildings);

WHEREAS, DOD has determined that some stipulations of the PMOA cannot be met and require modification;

WHEREAS, the parties to the PMOA have consulted regarding such modifications;

NOW, THEREFORE, it is mutually agreed that the PMOA is amended as follows:

A new stipulation I.A 1.d is added, to read as follows:

d. Identification of topics for further research, and plans for the conduct of such research.

Stipulation I.A.3 is amended to read as follows:

3. Submission of the above documentation to the HABS/HAER Regional Coordinators, not later than December 31, 1992.

Stipulation I.B. is amended by changing its second sentence to read as follows:

The HPPs will be submitted to the Council and the NCSHPO no later than December 31, 1992.

A new stipulation IV is added, to read as follows:

A. The signatories to this Agreement will undertake to ensure that relevant research activities carried out under Memoranda of Agreement, Programmatic Agreements, and other instruments executed pursuant to 36 CFR Part 800 are coordinated with implementation of this Agreement, in order to allow their results to be integrated with the development of documentation under stipulation I.

B. The signatories to this Agreement will cooperate with the National Building Museum in its development, if feasible, of a major exhibition concerning architecture and engineering in World War II, and will make information produced by research activities pursuant to this and other Agreements available to the National Building Museum for use in preparing such an exhibition. DOD will provide materials from this study to the National Building Museum for development of the exhibit.

PROGRAM COMMENT FOR
WORLD WAR II AND COLD WAR ERA (1939 – 1974)
AMMUNITION STORAGE FACILITIES

I. Introduction

This Program Comment provides the Department of Defense (DoD) and its Military Departments with an alternative way to comply with their responsibilities under Section 106 of the National Historic Preservation Act with regard to the effect of the following management actions on World War II and Cold War Era ammunition storage facilities that may be eligible for listing on the National Register of Historic Places: ongoing operations, maintenance and repair, rehabilitation, renovation, mothballing, cessation of maintenance, new construction, demolition, deconstruction and salvage, remediation activities, and transfer, sale, lease, and closure of such facilities.

The term Ammunition Storage Facilities means all buildings and structures, listed in or eligible for listing in the National Register of Historic Places, that were designed and built as ammunition storage facilities within the years 1939-1974, regardless of current use, and that are identified by a DoD Category Group (2 digit) code of 42, Ammunition Storage (category code 42XXXX), in the Military Service's Real Property Inventory currently or at the time of construction. Table 1 (attached) provides all such buildings and structures associated with ammunition storage, by Military Department, that are applicable to this program comment.

In order to take into account the effects on Ammunition Storage Facilities, DoD and its Military Departments will conduct documentation in accordance with The Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation. As each Military Department will be responsible for conducting its own mitigation actions, the following required documentation is structured by Military Department, followed by DoD-wide requirements.

II. Treatment of Properties

A. Army Mitigation

1. The Army shall expand and revise its existing context study, Army Ammunition and Explosives Storage in the United States, 1775-1945 to include the Cold War Era. This document provides background information and criteria for evaluating the historic significance of such buildings. The updated context study will:

identify the changes in ammunition storage during the Cold War;

focus on the changes required for ammunition storage due to technological advancement in weaponry;

consider the importance of major builders, architects or engineers that may have been associated with design and construction of Ammunition Storage Facilities throughout the Army or at specific Army installations; and

describe the inventory of Ammunition Storage Facilities in detail, providing information on the various types of buildings and architectural styles and the quantity of each.

2. The Army shall undertake in-depth documentation on Ammunition Storage Facilities at nine installations. The existing context study concluded that the Army possessed "only a few basic types and an abundance of examples" of Ammunition Storage Facilities, due to the standardization of ammunition storage facilities beginning in the 1920s. The context study suggests that six geographically dispersed installations contain an array of primary examples of both aboveground and underground magazines with a high degree of integrity:

Hawthorne Army Depot, Nevada – early igloos;

McAlester Army Ammunition Plant, Oklahoma – Corbetta Beehive;

Pine Bluff Arsenal, Arkansas – biological and chemical igloos;

Ravenna Army Ammunition Plant, Ohio – standard World War II and aboveground magazines;

Blue Grass Army Ammunition Plant, Kentucky – standard World War II igloos and aboveground magazines; and

Louisiana Army Ammunition Plant, Louisiana – Stradley special weapons.

The Army shall document these six as well as three additional installations that possess Cold War Era Ammunition Storage Facilities. Documentation at the three additional installations will be determined after completion of the expanded context study described in section II.A.1., above. This study will include a brief history of the installation and the surrounding community, if appropriate, and a detailed history of the storage facilities and documentation of the buildings. The documentation will primarily consist of historic photographs and existing plans. Documentation will be tailored to address the different natures of aboveground and underground storage.

B. Navy Mitigation

1. The Navy will develop a supplemental context study that will be attached as an appendix to the Army's existing context study, Army Ammunition and Explosives Storage in the United States, 1775-1945. The final product will be a separately bound volume of additional information and photographs and tabular appendices that, when presented with the Army's and Air Force's context studies, provide a clear picture of the Department of Defense's Ammunition Storage facilities. This context study appendix will:

cover both World War II and the Cold War Era, from 1939-1974;

explore the changes in ammunition storage resulting from World War II;

examine the changes required for ammunition storage due to technological advancement in weaponry during the Cold War;

consider the importance of major builders, architects or engineers that may have been associated with design and construction of Ammunition Storage Facilities; and

describe the inventory of Ammunition Storage Facilities in detail, providing information on the various types of buildings and architectural styles and the quantity of each.

2. The Navy shall document a representative sample of the basic types of both aboveground and underground ammunition storage facilities. The Navy will choose three geographically dispersed installations with the greatest number and variety of such resources. The Marines will choose one such installation. The sample chosen shall be the best representative examples of the range of Ammunition Storage types constructed during World War II and the Cold War era. This documentation will include collecting existing plans and drawings, writing a historic description in narrative or outline format, and compiling existing historic photographs of the structures. Documentation will be tailored to address the different natures of aboveground and underground storage.

C. Air Force Mitigation

1. The Air Force will develop a supplemental context study that will be attached as an appendix to the Army's existing context study, Army Ammunition and Explosives Storage in the United States, 1775-1945. The final product will be a separately bound volume of additional information and photographs and tabular appendices that, when presented with the Army's and Navy's context studies, provide a clear picture of the Department of Defense's Ammunition Storage facilities. This context study appendix will:

cover the Cold War Era, from 1946-1974;

explore the changes in ammunition storage resulting from the Cold War;

examine the changes required for ammunition storage due to technological advancement in weaponry during the Cold War;

consider the importance of major builders, architects or engineers that may have been associated with design and construction of Ammunition Storage Facilities; and

describe the inventory of Ammunition Storage Facilities in detail, providing information on the various types of buildings and architectural styles and the quantity of each.

2. The Air Force shall document a representative sample of the basic types of both aboveground and underground ammunition storage facilities. The Air Force will choose three geographically dispersed installations with the greatest number and variety of such resources. The sample chosen shall be the best representative examples of the range of Ammunition Storage types constructed during the Cold War era. This documentation would include collecting existing plans and drawings, writing a historic description in narrative or outline format, and compiling existing historic photographs of the structures. Documentation will be tailored to address the different natures of aboveground and underground storage.

3. The Air Force will not be required to consider its World War II Era facilities in these mitigation actions. The Air Force was established in September 1947 and therefore was not associated with structures constructed during this era. Rather the Air Force has inherited its current inventory of 263 World War II Era Ammunition Storage facilities from former Army installations. Given the substantial

mitigation actions that will be undertaken by the Army to document its facilities, further documentation for the small number of similar facilities located at Air Force installations provides no additional historic value. While no documentation will be done on World War II facilities under the Air Force's control, all of the 263 facilities in its inventory are covered under this Program Comment.

D. DoD-Wide Mitigation

1. Copies of the documentation described above will be made available electronically, to the extent possible under security concerns, and hard copies will be placed in a permanent repository, such as the Center for Military History.

2. In addition, as a result of on-going consultations, each Military Department will provide a list of properties covered by the Program Comment, by State, to State Historic Preservation Officers, Tribal Historic Preservation Officers, and other interested parties, as appropriate. Each Military Department will be responsible for determining how to convey its information.

3. All Military Departments will encourage adaptive reuse of the properties as well as the use of historic tax credits by private developers under lease arrangements. Military Departments will also incorporate adaptive reuse and preservation principles into master planning documents and activities.

The above actions satisfy DoD's requirement to take into account the effects of the following management actions on World War II and Cold War Era ammunition storage facilities that may be eligible for listing on the National Register of Historic Places: ongoing operations, maintenance and repair, rehabilitation, renovation, mothballing, cessation of maintenance, new construction, demolition, deconstruction and salvage, remediation activities, and transfer, sale, lease, and closure of such facilities.

III. Applicability

A. 1. This Program Comment applies solely to Ammunition Storage Facilities as defined in Section I, above. The Program Comment does not apply to the following properties that are listed, or eligible for listing, on the National Register of Historic Places: (1) archeological properties, (2) properties of traditional religious and cultural significance to federally recognized Indian tribes or Native Hawaiian organizations, and/or (3) ammunition storage facilities in listed or eligible National Register of Historic Places districts where the ammunition storage facility is a contributing element of the district and the proposed undertaking has the potential to adversely affect such historic district. This third exclusion does not apply to historic districts that are made up solely of ammunition storage facility properties. In those cases the Program Comment would be applicable to such districts.

Since the proposed mitigation for the Ammunition Storage facilities documents site plans, building designs, and the spatial arrangement of ammunition storage facilities, along with the events and actions that lead to the development of standardized ammunition storage facilities in DoD, the important aspects of ammunition storage, whether single buildings or districts made up entirely of ammunition storage, will be addressed regardless of the type of undertaking that may affect this particular property type. The one currently known ammunition storage district, at Hawthorne Army Ammunition Plant, has been identified for further study, as outlined in Section II(A)(2) above.

2. An installation with an existing Section 106 agreement document in place that addresses ammunition storage facilities can choose to:

(i) continue to follow the stipulations in the existing agreement document for the remaining period of the agreement; or

(ii) seek to amend the existing agreement document to incorporate, in whole or in part, the terms of this Program Comment; or

(iii) terminate the existing agreement document, and re-initiate consultation informed by this Program Comment if necessary.

3. All future Section 106 agreement documents developed by the Military Departments related to the undertakings and properties addressed in this Program Comment shall include appropriate provisions detailing whether and how the terms of this Program Comment apply to such undertakings.

IV. Completion Schedule

On or before 60 days following issuance of the Program Comment, DoD, its Military Department and ACHP will establish a schedule for completion of the treatments outlined above.

V. Effect of the Program Comment

By following this Program Comment, DoD and its Military Departments meet their responsibilities for compliance under Section 106 regarding the effect of the following management actions on World War II and Cold War Era ammunition storage facilities that may be eligible for listing on the National Register of Historic Places: ongoing operations, maintenance and repair, rehabilitation, renovation, mothballing, cessation of maintenance, new construction, demolition, deconstruction and salvage, remediation activities, and transfer, sale, lease, and closure of such facilities. Accordingly, DoD installations are no longer required to follow the case-by-case Section 106 review process for such effects. As each of the Military Departments is required under this Program Comment to document their own facilities, failure of any one Military Department to comply with the terms of the Program Comment will not adversely affect the other Departments' abilities to continue managing their properties under the Program Comment.

This Program Comment will remain in effect until such time as the Office of the Secretary of Defense determines that such comments are no longer needed and notifies ACHP in writing, or ACHP withdraws the comments in accordance with 36 CFR § 800.14(e)(6). Following such withdrawal, DoD and its Military Departments would be required to comply with the requirements of 36 CFR §§ 800.3 through 800.7 regarding the effects under this Program Comments' scope.

DoD, its Military Departments and ACHP will review the implementation of the Program Comment seven years after its issuance and determine whether to take action to terminate the Program Comment as detailed in the preceding paragraph.

Preserving America's Heritage

November 18, 2004

Mr. Donald R. Schregardus
Deputy Assistant Secretary (Environment)
Department of the Navy
1000 Navy Pentagon
Washington, DC 20350-1000

Dear Mr. Schregardus:

We are pleased to inform you that the Council members approved the *Program Comment for Wherry and Capehart Era Family Housing at Air Force and Navy Bases* (attached). In accordance with the Council's regulations at 36 CFR § 800.14(e)(5)(i), you may now take into account our comments for carrying out all Navy undertakings within this category.

If you decide to adopt our comments for this category of undertakings in lieu of conducting individual reviews under §§ 800.4 through 800.6, you must publish a notice of the Council's comments in the *Federal Register* and the steps you will take to ensure that effects to historic properties are taken into account.

If the Navy fails to carry out its undertakings for this category consistent with the Program Comment, the Council may withdraw the comment. If this were to occur, the Navy would be required to comply with §§ 800.3 through 800.6. The Navy may also decide that it no longer wants to comply with the Program Comment, in which case it must comply with §§ 800.3 through 800.6.

We appreciate the level of commitment and dedication of your staff in working with the Council on this issue, and we look forward to continuing to assist the Navy in managing its significant inventory of historic properties.

Sincerely,

John M. Fowler
Executive Director

enclosure

ADVISORY COUNCIL ON HISTORIC PRESERVATION

Preserving America's Heritage

Program Comment

for

Wherry and Capehart Era Family Housing At Air Force and Navy Bases

I. Introduction

This Program Comment, adopted pursuant to 36 CFR § 800.14(e), demonstrates Department of the Air Force (Air Force) and Department of the Navy (Navy) compliance with their responsibilities under Section 106 of the National Historic Preservation Act with regard to the following actions in the management of the Wherry and Capehart Era family housing: maintenance, repair, layaway, mothballing, privatization and transfer out of federal agency ownership, substantial alteration through renovation, demolition, and demolition and replacement of Wherry and Capehart Era housing, associated structures and landscape features that may be eligible for listing on the National Register of Historic Places.

II. Treatment of Wherry and Capehart Properties

A. Eligibility

The Department of the Army (Army) conducted a historic context of its Wherry and Capehart properties and documented these in a report entitled *For Want of a Home: A Historic Context for Wherry and Capehart Military Family Housing.* On May 22, 2001, the Army sponsored a

symposium on Wherry and Capehart era housing management as it related to historic preservation. The symposium was attended by preservation experts, including the National Trust for Historic Preservation (Trust), the National Conference of State Historic Preservation Officers (NCSHPO), the Advisory Council on Historic Preservation (ACHP), and nationally recognized experts in the field of historic preservation from academia and industry. Symposium participants recommended a programmatic approach to complying with Section 106, and these approaches were part of the Army's Program Comment which was approved by the ACHP in 2002 (67 FR 39332; June 7, 2002).

The Air Force and the Navy have gathered data on their inventory of Wherry and Capehart properties which will be appended to the Army's context study, as outlined below, to provide a comprehensive understanding of the Department of Defense (DoD) inventory for this property type. As with the Army, the Air Force and the Navy consider their inventory of Wherry and Capehart properties, including any associated structures and landscape features, to be eligible for the National Register of Historic Places for the purposes of Section 106 compliance.

B. Treatment

The Air Force and the Navy have requested a Program Comment as a service-wide Section 106 compliance action related to management of Wherry and Capehart Era housing, associated structures and landscape features. This programmatic approach will facilitate management actions for maintenance, repair, layaway, mothballing, privatization and transfer out of Federal agency ownership, substantial alteration through renovation, demolition, and demolition and replacement of Wherry and Capehart Era housing, associated structures and landscape features. Such actions present a potential for adverse effects to historic properties.

Based on the Program Comment previously approved for the Army for this property type, and following meetings with the ACHP, the Trust and NCSHPO, the Air Force and the Navy agree to the following six-step approach to the treatment of its Wherry and Capehart properties:

(i) The Air Force and the Navy will:

> (a) revise the Army's historic context, *The Wherry and Capehart Era Solutions to the Postwar Family Housing Shortage (1949–1962): A Historic Context,* to include information pertinent to Air Force and Navy bases where this information differs from that provided in the Army's context study, including information on Navy and Air Force Capehart and Wherry Era Housing architects, sponsors and bidders, & projects. The expanded context study will provide a more complete picture of Wherry and Capehart Era family housing across DoD, and
>
> (b) upon completion of the revised context study, the Air Force and the Navy will use it and any resulting oral histories recorded in accordance with section II(B)(vi), below, to prepare a report suitable for release to the general public. The report to the public will extract that information which may be deemed sensitive or inappropriate for release to the public; the resulting context study will be placed on a publicly accessible web site and

copies of the report will be provided to all the SHPOs, NCSHPO, the Trust and the ACHP.

(ii) The Navy and Air Force will review the results of the expanded and revised context study and determine whether any of those properties identified under Section II(B)(i)(a) are of particular importance. The Navy and Air Force will notify the Council of the results of this review, and the Council will forward the results to the NCSHPO, and the Trust.

(iii) The Air Force and Navy will use, or modify for their own use, the Army's design guidelines: *Neighborhood Design Guidelines for Army Wherry and Capehart Housing.* Modified design guidelines will be provided to ACHP for review. Copies of the Air Force and Navy guidelines will be provided to the NCSHPO, the Trust and the ACHP. These Neighborhood Design Guidelines will be distributed by Headquarters, Air Force and Navy to those offices that manage and maintain this housing type and they will be encouraged to consider the design guidelines in planning actions that affect their Wherry and Capehart Era housing, associated structures and landscape features.

(iv) For Wherry and Capehart properties that have been determined to be of particular importance, as defined in the revised context study, the Air Force and the Navy will:

(a) consider the need to conduct additional historical documentation, and

(b) within funding and mission constraints, consider the preservation of these properties through continued use as military housing.

(v) The Air Force and the Navy will advise developers involved in housing privatization initiatives that Wherry and Capehart properties may be eligible for historic preservation tax credits.

(vi) The Air Force and the Navy will attempt to locate and conduct oral interviews with military families who lived in Wherry and Capehart housing (which may include Army families), and other people who were involved with design and construction of Capehart and Wherry Era housing. Prior to conducting any interviews, the Air Force and the Navy will seek advice from appropriate government offices such as the Library of Congress' *Veterans History Project* and the military service historical centers to develop a set of appropriate interview questions and proper formats in which interviews would be recorded. Upon completion of the oral histories, the Air Force and the Navy will provide a copy of all written and recorded documentation to the Library of Congress.

III. Applicability

This Program Comment does not apply to the following properties that are listed, or eligible for listing, on the National Register of Historic Places:

(i) archeological sites,

(ii) properties of traditional religious and cultural significance to federally recognized Indian tribes or Native Hawaiian organizations, or

(iii) historic properties other than Air Force and Navy Wherry and Capehart Era housing, associated structures and landscape features.

V. Schedule for Completion:

(i). Within 12 months from Council approval of the Program Comment, the Air Force and Navy shall complete:

(a). the expanded and revised context study for Capehart and Wherry Era housing as described in Section II(B)(i)(a), above;

(b). review of the context study for properties of particular importance as described in II(B)(ii), above; and

(c). adoption of the design guidelines as described in Section II(B)(iii), above.

(ii) Within 24 months from Council approval of the Program Comment, the Navy and Air Force shall complete:

(a). its consideration of properties of particular importance as described in Section II(B)(iv), above;

(b). completion of the oral history segment of the mitigation, as described in Section II(B)(vi), above, and

(c). completion of the context study suitable for release to the general public, as described in Section II(B)(i)(b), above.

IV. Effect of Program Comment

The ACHP believes that this six-step approach will ensure that the Air Force and the Navy take into account the effects of management of their Wherry and Capehart era housing. By following this comment and outlined six-step approach, the Air Force and the Navy will have met their responsibilities for compliance under Section 106 regarding management of their Wherry and Capehart era housing. Accordingly, Air Force and Navy bases will not have to follow the case-by-case Section 106 review process for each individual management action.

The Air Force and the Navy may carry out management actions prior to the completion of all of the six treatment steps outlined above, so long as such management actions do not preclude the eventual successful completion of those six steps.

This Program Comment will remain in effect until such time as the Air Force or the Navy determines that such comments are no longer needed and notifies ACHP, in writing, or the ACHP determines that the consideration of Wherry and Capehart properties is not being carried out in a manner consistent with this Program Comment. The ACHP may withdraw this Program Comment in accordance with 36 CFR §800.14(e)(6). Following such withdrawal, the Air Force and the Navy would comply with the requirements of 36 CFR §§ 800.3 through 800.7 for each individual management action.

The ACHP Membership approved this Program Comment on November 18, 2004.

John L. Nau, III

NAVY CORRESPONDENCE

Navy Responses to Public Comments

Navy Correspondence with SHPO

Navy Responses to Comments
on
"Combined Specific Buildings Survey and Evaluation Report /
Cold War Era Historic Resources Survey and Evaluation Report for Naval Air Station Alameda"
(dated August 2010)

Comment #	PAGE REFERENCE: Section/ DPR 523 Resource Name Page/ Line	Comment	Comment By	Navy Response
1.	App. C Control Tower 1085-1095	The DPR on this building doesn't adequately assess the significance and integrity of Building 19 as a contributor to the district. The Tower is a symbol of NAS and the one building that is key to understanding the function of a Naval Air Station. The NAS could not have existed without the Tower. We think the Control Tower retains adequate integrity to convey its significance. The DPR states that the Tower contained three functions, of which only one is still represented (page 1091). This is not accurate. The Tower's primary function was flight control (this included operations and weather): about 70% of the building was used for these functions. Crash and rescue function represented a smaller proportion. Flight control was the primary importance of the building, and that is represented by the building that remains. The primary elevation of this building is the west side; this is the side pilots viewed as they flew in to NAS. This elevation has changed very little since the period of significance. The discussion of the integrity of the Tower seems to use a different standard, when compared with how integrity is considered with	AAPS	The Navy considered this comment, and other comments and photographs concerning Building 19, and has revised the report and site forms to record and analyze Buildings 19, 19-1, and 491 on separate DPR 523 site forms in Appendix C. The Navy has additionally revised the DPR 523 site form for Building 19. After additional research and analysis of the Building 19's construction progression, the Navy concurs that Building 19 retains sufficient integrity of location, design, setting, materials, workmanship, feeling and association to contribute to the NAS Alameda Historic District and convey its

		other district contributors. Loss of building wings. Building wings no longer extant included the rescue/crash garage on the far northwest end and the wooden wing on the northeast elevation. The northeast wing was on the rear elevation; removal of an element on a rear elevation is not as great a loss to the building's integrity as something on the primary elevation. For comparison, there are other district contributors which have lost large building elements from major elevations, such as the Cleaning Room from the south elevation of Building 5, yet this building is now considered a district contributor (refer to App. C, Diagram on page 166 and Photo 18 on page 169). Addition of building wing. The yellow wing to the southeast was added ca. 1990 (the DPR does not provide a date); the addition is on a secondary elevation, not the primary elevation. The addition of a small wing is similar to the addition of sunporches to the Big Whites, which also occurred after the Period of Significance (refer to App. C, p. 1195); the sunporches were judged not to detract from the integrity of the Big Whites. The DPR form is a little unclear about whether Buildings 19-1 and 491 are additions to the historic building (page 1093); they are in fact freestanding and do not present a loss of integrity to the Tower. The discussion of the integrity of the Tower also seems to use an inconsistent standard of integrity when compared with the evaluation of the Air Terminal (Building 77) (App. C, pages 530-533). The Radio/Radar Building (77) was remodeled in 1960 to become an Air Terminal; a completely new 3rd story in different materials was added after the Period of Significance. However, this potential loss of integrity is not considered important because the style of the addition is consistent with the Moderne style of the Air Terminal. We suggest that the addition to the Tower of the yellow wing on the southeast is a similar case: it also is a minimalist, boxy form with a similar surface appearance and square, metal frame windows that suggest the historic windows of the Tower.		period of significance from 1938-1945. On this basis, the Navy has revised its finding to conclude that Building 19 meets the criteria for listing on the National Register as a contributing element to the NAS Alameda Historic District. The Navy has additionally revised the boundaries of the NAS Alameda Historic District to include Building 19 as a contributing element.

		A complete evaluation of the essential physical features of a flight control tower would include: a tall tower for viewing aircraft and runways at a distance; a glazed control room at top; control room equipment; offices containing the weather, flight information and other subsidiary functions; location or siting of the tower at the intersection of runways and the seaplane lagoon and at an outer edge of the station facing the Bay. In Alameda's case, the building also contained a crash/rescue garage. Of these features, only two are not extant: the crash/rescue garage and the equipment. The property retains most of the physical features essential to convey its significance. We would like to note that, in comparison with the evaluation of the Tower, the evaluation of the Radio Transmitter building (Building 35) (App. C, page 382) mentions that the removal of a rooftop antenna is not a serious loss to the building's integrity, although this would have been an essential physical feature for a Radio Transmitter Building. In addition, presumably the radio equipment that Building 35 once contained is also no longer extant, although this is not considered a significant loss of integrity. Following National Register guidance in Bulletin 15, a review of the seven aspects of integrity (location, design, setting, materials, workmanship, feeling, association) under both criteria A (events) and C (design/architecture) shows that Design and Materials have been partially altered and the remaining aspects have high integrity. The National Register doesn't require that all aspects of integrity be intact. Finally, as Bulletin 15 of the National Register guidance states, a basic test of integrity for properties eligible under criterion A (historic events) of the National Register is whether a person from the Period of Significance would recognize the building. There is no question that this building would still be recognizable to a person of the period. Submitted by Elizabeth Krase Greene on behalf of AAPS, 11/14/2010.		

2.	Appendix C Aircraft Maintenance Shops 11 & 12 13 Paragraph 4; Line 9	"The entire facades of Buildings 11 and 12 were removed as a part of construction leaving only three original walls for each of these buildings." The entire facades of buildings 11 & 12 were not removed. More than 3 of the original exterior walls remain. Half of the 4th façade remains.	Author: Dennis M Owens Chair Alameda HAB and supported by Judith Lynch (HAB Board Member	The Navy has considered the 6 comments and associated photographs provided by the HAB concerning the Aircraft Maintenance Shops (Buildings 11, 12, and 400). The Navy has revised the DPR 523 site form to clarify that the original hangar doors of Buildings 11 and 12 are partially visible in the southern half of Building 400 (known as 400A). The Navy made additional edits to the site form to clarify the impacts to the historic integrity of Buildings 11 and 12 that occurred by Building 400's construction, making note of the existing interdependence of these three components of the extant facility, and the integrity of the Building 11/12/400 complex as it relates to the period of significance (1938-1945). Although the Navy agrees that portions of the original hangar doors remain, the Navy does not find that this remaining historic fabric is sufficient to conclude that the former two seaplane hangars (Buildings 11 and 12) retain sufficient integrity for listing in the National Register of Historic Places. Despite the Navy's naming conventions for its facilities, Buildings 11, 12, and 400 now comprise a single complex because the Building 400 component adjoins fully with

				the sides of the original Buildings 11 and 12. National Register guidance indicates that buildings and structures are to be evaluated as a whole and this is appropriate for inventory and evaluation of the Building 11/12/400 complex. "Parts of buildings, such as interiors, facades, or wings, are not eligible independent of the rest of the existing building."[1] Construction of Building 400/400A resulted in a new building complex composed of three components, and these components are thus no longer independent for the purposes of evaluation. Additionally, evaluation must also be based upon the current conditions, not the potential for restoration.[2] As documented in the revised DPR 523 form, the construction of Building 400/400A (1955-1957) between Buildings 11 and 12 affected the massing, spatial relationship, and proportions of the former seaplane hangars. Alterations made to the original Buildings 11 and 12, which resulted in the Aircraft

[1] US Department of the Interior, National Park Service, *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington DC: National Park Service, 1995) 4.

[2] US Department of the Interior, National Park Service, *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington DC: National Park Service, 1995) 47. Regarding buildings covered by non-historic materials, for example, the bulletin states, "If a property's exterior is covered…the property will not qualify under Criteria A, B, or C, because it does not retain the visual quality necessary to convey historic or architectural significance. Such a property also cannot be considered a contributing element in a historic district, because it does not add to the district's sense of time and place. If the false front, curtain wall, or non-historic siding is removed and the original building materials are intact, then the property's integrity can be re-evaluated."

				Maintenance Shop (Building 11/12/400 complex), prevent the former hangars from conveying the significance of the NAS Alameda Historic District in the 1938-1945 period. Therefore, the Navy finds that the Building 11/12/400 complex (and by extension, each of its components) is a non-contributing element of the NAS Alameda Historic District.
3.	Appendix C Aircraft Maintenance Shops 11 & 12 16 Paragraph 4; Line 6	"…all traces of hanger doors have been removed and replaced with solid interior walls." At least half of the South facing hanger doors in buildings 11 and 12 remain. See photos in comment spaces 4, 5 & 6. The Southern pylons remain.	Author: Dennis M Owens Chair Alameda HAB and supported by Judith Lynch (HAB Board Member	Please see above response regarding the Aircraft Maintenance Shops (Buildings 11, 12, and 400).
4.	Appendix C Aircraft Maintenance Shops 11 & 12 16 Paragraph 4; Line 8	"…the buildings do not retain integrity of design, materials, materials, workmanship or feeling and are not contributors to the NAS Alameda Historic District." Given that building 11 & 12 have three remaining facades intact, the interior exposed structure intact and half of their fourth façade intact (now interior walls facing building 400) **both building 11 and building 12 retain the integrity necessary to be Contributors to the district.** In evaluating the criteria of integrity for a Contributor to a historic district (not an individual listing) it is intuitive and essential to ask "Would the historic district loose part if its integrity if these buildings were absent?" It is the integrity of the district that must be used as the measure to determine the value of its Contributors. It is clear that the district would loose a part of its integrity if these two buildings were absent. The sub-district relating to seaplane activity would loose a very large part of its integrity if these two buildings anchoring the Western portion and forming 40% of the total were not considered as contributing. The district and its Contributors are National Register eligible under both criteria A (historic Association) and criteria C (moderne/industrial style military master planning).	Author: Dennis M Owens Chair Alameda HAB and supported by Judith Lynch (HAB Board Member	Please see above response regarding the Aircraft Maintenance Shops (Buildings 11, 12, and 400).

		Under criteria A "A property that is significant for its historic association is eligible if it retains the essential physical features that made up its character or appearance during the period of its association with the important event, historical pattern, or person(s)." Buildings 11 & 12 continue to clearly represent Seaplane hangers. Their essential characteristics, most of their hanger doors facing paved taxiways are the physical features which continue to present the historic function that these building served during the WW2 era. Buildings 11 and 12 are essential in completing an unbroken row of seaplane hangers facing the Seaplane Lagoon and its taxiways. Under criteria C : A property that has lost some historic materials or details can be eligible *if* it retains the majority of the features that illustrate its style in terms of the massing, spatial relationships, proportion, pattern of windows and doors, texture of materials, and ornamentation." Each of these buildings contains at least 75% of their historic features, three out of four exterior facades facing open space. This is a majority. Also one half of the fourth façade which currently faces the interior of building 400 remains. Additionally the large span interior space necessary for their original function, maintaining large seagoing aircraft, is also substantially intact.		

5.	Appendix C Interior of building 11 facing East Showing remaining hanger door adjoining building 400 16 Paragraph 4; Line 6		DMO Oct 6, 2010 Author: Dennis M Owens Chair Alameda HAB and supported by Judith Lynch (HAB Board Member	Please see above response regarding the Aircraft Maintenance Shops (Buildings 11, 12, and 400).
6.	Appendix C Interior of building 400 facing East showing remaining hanger door of Building 12. 16 Paragraph 4; Line 6		Bill Elliot Aug. 7, 2004 [Sent as a part of Alameda HAB Comments]	Please see above response regarding the Aircraft Maintenance Shops (Buildings 11, 12, and 400).

7.	Appendix C Interior of building 400 facing West showing remaining hanger door of Building 11. 16 Paragraph 4; Line 6		Bill Elliot Aug. 7, 2004 [Sent as a part of Alameda HAB Comments]	Please see above response regarding the Aircraft Maintenance Shops (Buildings 11, 12, and 400).
8.	Appendix C Control Tower Element of Building 19 1085 Heading Paragraph line3 and P3a. Paragraph 4	**"The re-evaluation contained herein concludes that Building 19 is not eligible for listing in the NRHP individually, nor is it a contributing element of the NAS Alameda Historic District."** **The Control Tower Element of building 19 is a contributing element of NAS Alameda Historic District.** Paragraph 4 provides an excellent description of the Control Tower Element, which is a portion of building 19. The Control Tower Element is the Keystone element of the NAS Alameda Historic District. Its location connects the seaplane lagoon with the land airstrip and oversees both the seaplane and land based airplane hangers. Although modifications have been made to other portions of building 19 the Control Tower Element retains the necessary features of integrity under both criteria A and criteria C. In evaluating the criteria of integrity for a Contributor to a historic district (not an individual listing) it is intuitive and essential to ask "Would the historic district loose part if its integrity if this element was absent." It is the integrity of the district that must be used as the measure to determine the value of its Contributors. The district would loose a part of its integrity if the Control Tower Element were absent. The land and air operations, essential to the NAS Alameda Historic District relied on this key element and are only truly tied together by its presence. Under criteria A "A property that is significant for its historic	Dennis M Owens Chair Alameda HAB	Please see above response re: Building 19.

		association is eligible if it retains the essential physical features that made up its character or appearance during the period of its association with the important event, historical pattern, or person(s)." The Control Tower Element continues to dominate the lagoon and airfield and its intended functions are still visually observable and understood by even a casual observer. Under criteria C : A property that has lost some historic materials or details can be eligible *if* it retains the majority of the features that illustrate its style in terms of the massing, spatial relationships, proportion, pattern of windows and doors, texture of materials, and ornamentation." By reviewing the Control Tower Element as a distinct property the majority of historic features that illustrate its style and function clearly remain. See Photo in number 8. As the Control Tower is contiguous to the current historic district boundaries, the boundaries should be adjusted to reflect its inclusion.

Sacramento, CA 95816

Ms. Louise Brodnitz
Historic Preservation Specialist
Advisory Council on Historic Preservation
Old Post Office Building
1100 Pennsylvania Avenue, NW, Suite 803
Washington, DC 20004

Dear Mr. Beason and Ms. Brodnitz:

The Navy is continuing consultation with your offices in accordance with the National Historic Preservation Act's implementing regulations for a Programmatic Agreement (PA) (36 C.F.R. § 800.14(b)) regarding the interim management, property transfer, and reuse of the former Naval Air Station (NAS) Alameda, California. To support development of this PA, the Navy has prepared the enclosed "Combined Specific Buildings Survey and Evaluation Report / Cold War Era Historic Resources Survey and Evaluation Report for Naval Air Station Alameda" (Combined Evaluation Report, hereafter) (enclosure (1)). This letter transmits the Navy's combined evaluation report, summarizes the Navy's findings regarding the identification of historic properties, and formally seeks SHPO and ACHP concurrence on the findings. We request your concurrence on our report's findings by **November 15, 2010**. Via separate correspondence, the Navy is also concurrently seeking and considering the input of the consulting parties identified in the distribution list in enclosure (2).

Identification of Historic Properties

The purpose of the enclosed Combined Evaluation Report is to finalize the Navy's evaluation of buildings and structures at the former NAS Alameda. This single report combines two analyses: 1.) the survey and evaluation of specific pre-1945 buildings as requested by consulting parties and/or as determined necessary by the Navy, and 2.) the basewide Cold War-era Survey and Evaluation of all buildings and structures built or reused during the Cold War period (1946-1989).

The Navy is also preparing a Cultural Landscape Report (CLR) to identify the potential for National Register-eligible cultural landscape(s) at the former base. The Navy intends to consult with the SHPO, ACHP, and the consulting parties when this report is complete. Taken together, the Combined Evaluation Report and the CLR will finalize the Navy's identification of historic properties effort at the former NAS Alameda and will provide the basis for the Navy's future National Register Nomination of the NAS Alameda Historic District.

Findings of the Combined Evaluation Report

Based upon the research and analysis included in the enclosed Combined Evaluation Report, the Navy finds the following:

1. No buildings or structures at NAS Alameda appear to be eligible for listing in the National Register of Historic Places (NRHP) for Cold War-era significance. No buildings or structures appear individually eligible for associations with the Cold War-era and no historic district based upon Cold War-era use has been identified.
2. No buildings or structures at the former NAS Alameda appear to be individually-eligible for listing in the NRHP for their WWII-era significance.
3. All previous contributing elements of the NAS Alameda Historic District (as identified in the original 1992 evaluation (Woodbridge) and in the 1999 Section 106 Memorandum of Agreement (MOA)) retain integrity and thus remain contributing elements of the historic district.
4. The NAS Alameda Historic District is eligible for the National Register under Criteria A and C with a period of significance from 1938-1945. The Navy has identified twelve (12) additional contributing elements to this historic district.

More specifically, the Navy finds that the following 12 buildings and structures are contributing elements to the NAS Alameda Historic District. Seven of these contributing elements are the Seaplane Lagoon, and six of the Lagoon's constituent elements (four Seaplane Ramps, Bulkhead, and Jetty).

Newly-Identified Contributing Elements to the NAS Alameda Historic District

Building Number	Historic Function	Year Built
5	Overhaul and Repair Shops	1940
10	Power Plant Building	1940
15	Boathouse	1940
35	Radio Transmitter Building	1940
64	Boiler / SIMA Diving Locker	1941
No Number	Seaplane Lagoon	1940
Ramp 1	Seaplane Ramp #1	1940
Ramp 2	Seaplane Ramp #2	1940
Ramp 3	Seaplane Ramp #3	1941
200648	Bulkhead	1938
200650	Jetty	1939
200687	Seaplane Ramp #4	1940

The addition of these new contributing elements also expands the NAS Alameda Historic District boundary. The new boundary for the Historic District is depicted in Enclosure (3).

Consultation Meeting Regarding the Combined Evaluation Report

As you know, the Navy is proposing a Section 106 consultation meeting on September 28, 2010 to distribute the Combined Evaluation Report and to provide a summary of the findings for all consulting parties. Although SHPO and ACHP representatives will be participating in this meeting, please let us know if you would like additional briefings or discussions of the document.

We intend for the September 28, 2010 consultation meeting to "kick-off" a 45–day consulting party review and comment period on the Combined Evaluation Report. The Navy intends to host an additional consultation meeting toward the end of October, 2010 to respond to questions and comments from the consulting parties before their written comments are due. The deadline for submittal of consulting party comments will then be November 15, 2010. We also respectfully request SHPO and ACHP concurrence on the findings of the enclosed Combined Evaluation Report by November 15, 2010. Please send your comments/concurrence to Ms. Erica Spinelli at the address above.

RE: Former Naval Air Station Alameda Cold War Update, Naval Air Station Alameda, CA

Dear Mr. Lee:

Thank you for consulting with me on the above-referenced undertaking. Pursuant to 36 CFR Part 800, the regulations implementing Section 106 of the National Historic Preservation Act (NHPA), the United States Navy (Navy) is seeking my concurrence with a number of Determinations of Eligibility for the above-referenced undertaking.

The Navy proposes to update the Air Station Alameda Historic District, an assemblage of buildings and structures associated with World War II. Eighty-five properties were determined eligible for listing on the National Register of Historic Places (NRHP) as an historic district in 1992. In 1997, the Navy, through further consultation with the State Historic Preservation Officer, corrected the number of contributing buildings, revising the number upwards from 85 to 87. Since this time, the Navy has updated the survey to consider the base's importance within the context of the Cold War (1946-1989). Several World War II-era properties were also re-evaluated. The results of these identification efforts are collected in the following document:

- *Combined Specific Buildings Survey and Evaluation Report / Cold War Era Historic Resources Survey and Evaluation Report for Naval Air Station Alameda* (JRP Historical Consulting LLC: August 2010)

This report addresses 442 buildings, structures, and objects. All of the 442 properties were evaluated for potential significance within the context of the Cold War. A subset of 105 buildings and structures built prior to 1946 received further evaluation with regard to their significance within the context of World War II and potential to the NAS Alameda Historic District. This study indentifies twelve new contributors to the district, and recommends expanding the historic district boundaries to encompass these resources. The following twelve buildings have been added to the district:

- Seaplane Lagoon
- Seaplane Lagoon Ramp 1
- Seaplane Lagoon Ramp 2
- Seaplane Lagoon Ramp 3
- Seaplane Lagoon Ramp 4
- Bulkhead (Building 200648)
- Jetty (Building 200650)
- Building 5
- Building 10

- Building 15
- Building 35
- Building 64

The report also concludes that none of the 442 buildings and structures evaluated for significance within the Cold War context meets the criteria for listing in the NRHP or the California Register of Historic Resources, either individually or as a grouping.

Having reviewed your submittal, I concur that the above-listed properties are eligible for listing on the NRHP as contributors to the Air Station Alameda Historic District. I also agree that none of the 442 properties has a historically significant association with the Cold War and are ineligible for listing on the NRHP within this context. Please be reminded that in the event of a change in project description or inadvertent discovery, you may have additional responsibilities under 36 CFR Part 800.

Thank you for seeking my comments and considering historic properties as part of your project planning. If you have any questions or concerns, please contact Tristan Tozer of my staff at (916) 445-7027 or at email at ttozer@parks.ca.gov.

Sincerely,

Susan K Stratton for

Milford Wayne Donaldson, FAIA
State Historic Preservation Officer

Mr. Tristan Tozer
California Department of Parks and Recreation
Office of Historic Preservation
1725 23rd Street, Suite 100
Sacramento, CA 95816

Dear Mr. Tozer:

The purpose of this letter is to request continued consultation with your office on the Navy's Draft "Combined Specific Buildings Survey and Evaluation Report/Cold War Era Historic Resources Survey and Evaluation Report for Naval Air Station Alameda" (Combined Evaluation Report) of August 2010. Since the Office of Historic Preservation's (OHP) concurrence on the findings of the draft Combined Evaluation Report, the Navy has identified Building 19 (Control Tower) as a contributing element of the Naval Air Station (NAS) Alameda Historic District and therefore seeks your concurrence on this revised finding.

The Navy began consultation with the OHP and consulting parties on the draft Combined Evaluation Report in September 2010. Consulting party comments were shared with your office on December 10, 2010, and OHP concurrence on the report findings was received on January 7, 2011 (Reference # USN090603A). Additional research into the construction history of Building 19 conducted in response to consulting party comments led to the Navy's revised conclusion that Building 19 retains sufficient integrity of location, design, setting, materials, workmanship, feeling and association to contribute to the NAS Alameda Historic District and convey its period of significance from 1938-1945. Navy response to Alameda Architectural Preservation Society's comment #1 in the enclosed draft Navy Responses to Comments matrix and the revised draft Department of Parks and Recreation (DPR) 523 site form for Building 19 collectively provide the consulting party comments, results of our research, and the rationale for our revised finding on Building 19 (enclosures 1 and 2).

The Navy intends to revise the historic district boundary and resource counts in the final report to reflect our revised finding on Building 19. All other eligibility findings provided in the draft Combined Evaluation Report will remain unchanged. Prior to finalizing the report and releasing Navy Responses to Comments to all consulting parties, we seek OHP concurrence with our revised finding for Building 19. We respectfully request your comments/concurrence by June 9, 2011 in order to support our project schedule.

RE: Former Naval Air Station Alameda Cold War Update, Naval Air Station Alameda, CA

Dear Mr. Megliola:

Thank you for consulting with me on the above-referenced undertaking. Pursuant to 36 CFR Part 800, the regulations implementing Section 106 of the National Historic Preservation Act (NHPA), the United States Navy (Navy) is seeking my concurrence with a revised Determination of Eligibility associated with the above-referenced undertaking.

In our previous round of consultation I concurred that Building 19, an air traffic control tower constructed in 1941, was ineligible for inclusion on the National Register of Historic Places (NRHP) as a contributor to the Naval Air Station Alameda Historic District (District). I based my conclusions on the documentation submitted as part of the Navy's identification efforts. Since this time the Alameda Architectural Preservation Society has presented the Navy with additional information about the history of Building 19. The results of this new research into the construction history of this property has led the Navy to reconsider its findings; the Navy now considers the property eligible for listing on the NRHP and would like to redefine the boundary of the District to reflect this fact. The Navy also intends to revise the resource counts in the *Cold War Update* to reflect this revision. All other eligibility determinations listed in the document will remain unchanged. In addition to your letter, you have provided the Preservation Society's comments and a revised DPR 523 form

Having reviewed this submittal, I concur that Building 19 is eligible for listing on the NRHP as contributor to the District. Under Criterion A, the property can be considered a contributor because of its important role with the station as the control point for flight operations, its association with the strategic development of Naval air stations in the 1930s, the development of naval facilities in the San Francisco Bay Area during World War II, and its association with station's role in the Pacific theater naval operations during the War. The property is also eligible under Criterion C. Despite extensive interior renovations and the removal of building wings, the property retains essential physical features that convey its significance within the District, namely its historic massing, proportions, door and window patterns, and spatial relationships between its various components.

Thank you for considering historic properties as a part of project planning. Please be reminded that in the event of a change in project description or inadvertent discovery, you may have additional responsibilities under 36 CFR Part 800. If you have any questions or concerns, please contact Tristan Tozer of my staff at (916) 445-7027 or at email at ttozer@parks.ca.gov.

Sincerely,

Susan K Stratton for

Milford Wayne Donaldson, FAIA
State Historic Preservation Officer
